## ***SECTION 1***

## ***DISCUSSION***

## **INTRODUCTION**

The project site encompasses approximately 18.9 acres of residential property located on the north side of Alta Loma Road between Hillview Road and Sunset Road in Joshua Tree, an unincorporated area of San Bernardino County. The development of the site will be a residential subdivision per Tentative Tract 20443.

The purpose of this study was twofold, one to determine the impact, if any, of the 100-year storm off-site runoff flow tributary to the project site as delineated on the map contained in this study and the second to determine the rate of runoff flow before and after development of the site and recommended mitigations which are needed to protect the proposed development from these storm events.

The FEMA flood zone designation for this area from FIRM Panel 06071C8880H is Zone D, which indicates an area of undetermined flood hazard. A copy of the FIRMette is included in the appendix of this report.

## **METHODOLOGY**

The method in determining the peak off-site runoff flows was the rational method as specified in the 1986 San Bernardino County Hydrology Manual and the 2010 San Bernardino County Hydrology Manual Addendum for Arid Regions. The existing offsite flow was examined and delineated from U.S.G.S. Map: Joshua Tree South and an examination of the project site. The current project is for lot sales and minimal onsite disturbance of the existing condition is expected. Offsite tributary areas to the south and west were examined to determine the tributary storm runoff to the site.

On-site storm runoffs were determined using a unit hydrograph analysis of the undeveloped and developed sites. These runoff flows will be carried through the street rights-of-way and through cross-lot drainage as the lots are sold and developed.

Point rainfalls for the 100-year storm were obtained from the NOAA Atlas 14 per the 2010 Addendum to the County Hydrology Manual. The 100-year 1-hour point rainfall

for the site is 1.86". The 2010 Addendum states that the AMC methodology approach is to be used for calculating the 100-year storm event. Additionally, in the 2010 Addendum, the county issued new mapping indicating where AMC I and AMC II conditions were to be implemented in the arid, desert regions of the county. Using the ADD-1 MAP from the SB County Addendum "AMC Condition Map" the project off-site watershed is in AMC II and part of the on-site is in AMC I. To be conservative we will use AMC II for both off-site and on-site analysis. The AMC condition map from the addendum is included as exhibits in section 3 of this report.

The soils types were determined to be Soil Type C in the watershed per the soil maps in the San Bernardino County Hydrology Manual. Rainfall and soils maps are included as exhibits in Section 3 of this report.

The off-site tributary areas examined in this study are shown in Table A.

Table A (Off-Site)

<b>Sub-area</b>	<b>Elevation Difference (ft.)</b>	<b>Length (ft)</b>	<b>Area (Acres)</b>	<b>Avg. Slope (ft/ft)</b>
Node 11 – Node 16	439	6,613	109.8	0.0664
Node 21 – Node 24	176	3,256	23.5	0.0541

The on-site tributary areas examined in this study are shown in Table B.

Table B (On-Site)

<b>Sub-area</b>	<b>Elevation Difference (ft.)</b>	<b>Length (ft)</b>	<b>Area (Acres)</b>	<b>Avg. Slope (ft/ft)</b>
On-site Undeveloped Unit Hydrograph	69	1,644	21.1	0.0420
On-site Developed Unit Hydrograph	67.5	1,473	18.9	0.0458

## **EXISTING CONDITIONS**

The site is located along the north side of Alta Loma Road and bordered by Hillview Road to the west and Sunset Road to the east. The property is currently a vacant, 18.9-acre parcel. The west tributary area flows northward within the Hillview Road right-of-way and encroaches the project slightly at the northwest property corner. There is existing scour at this location from the offsite flow. This existing, unimproved channel is not a “blueline” stream on the U.S.G.S. maps and is local to the runoff in this area. From our investigation and the biological study performed for this project, this channel is not within the jurisdiction of US Army Corps of Engineers or California Department of Fish and Wildlife.

The results of the off-site and on-site flow analysis are summarized in Table C.

Table C

<b>Sub-Area</b>	<b>Q<sub>100</sub> (cfs)</b>
Node 11 – Node 16 Off-site	285.9
Node 21 – Node 24 Off-site	72.3
On-site Undeveloped Condition	84.5
On-site Developed Condition	74.9

## **CONCLUSIONS AND RECOMMENDATIONS**

During our field investigation of the site, we observed the existing conditions as stated previously. Development of the project is being performed in conjunction with engineered improvement plans and planned for future lot sales.

Off-site stormwater tributary to the western property boundary is conveyed north within the right-of-way of Hill View Road, past the project site, following its historical flow path. A drainage easement is recommended at the northwest corner of the proposed tentative tract from the right-of-way to the top of the existing slope of the existing off-site drainage path. The peak Q100 flow rate of this tributary flow is 285.9 cfs.

Off-site stormwater tributary to the southern property boundary will be intercepted within the improvements of Alta Loma Road and conveyed east following the historical flow path. This flow will be intercepted by parkway drains along the north side of Alta Loma Road as it approaches the intersection with Sunset Road. This drainage will be conveyed north within a 20' wide drainage easement along the project's eastern boundary and discharged onto Sunset Road near the northeastern section of the project at the historical flow location. The peak Q100 flow rate of this tributary flow is 72.3 cfs.

Per the Unit Hydrograph analysis, the on-site Q100 stormwater flow rate prior to development is estimated at 84.5 cfs and the post-development Q100 flow rate is estimated at 74.9 cfs. Runoff volume from the undeveloped site is approximately 5.94 Ac.Ft, while runoff volume from the developed site is approximately 5.27 Ac.Ft. Post-development peak runoff flow rates are required to be less than 90% of the pre-development peak runoff flow rate. The post-development peak flow rate is approximately 88.6% of the pre-development peak flow rate while the post-development runoff flow volume is approximately 88.7% of the predevelopment runoff volume, therefore no on-site retention is required.

On-site runoff flows will exit the site through under-sidewalk (parkway) drains along Sunset Road at the northeast corner of the project site. Multiple parkway drain locations will be spaced along the frontage of Lot A to allow runoff to spread evenly as it flows back onto Sunset Road following its historical flow path.

\*\*\*\*\* Hydrology Study Control Information \*\*\*\*\*

Rational hydrology study storm event year is 100.0

Computed rainfall intensity:

Storm year = 100.00 1 hour rainfall = 1.860 (In.)

Slope used for rainfall intensity curve b = 0.7000

Soil antecedent moisture condition (AMC) = 2

+++++  
Process from Point/Station 21.000 to Point/Station 22.000  
\*\*\*\* INITIAL AREA EVALUATION \*\*\*\*

RESIDENTIAL(1 acre lot)

Decimal fraction soil group A = 0.000

Decimal fraction soil group B = 0.000

Decimal fraction soil group C = 1.000

Decimal fraction soil group D = 0.000

SCS curve number for soil(AMC 2) = 69.00

Pervious ratio(Ap) = 0.8000 Max loss rate(Fm)= 0.438 (In/Hr)

Initial subarea data:

Initial area flow distance = 1000.000(Ft.)

Top (of initial area) elevation = 3198.000(Ft.)

Bottom (of initial area) elevation = 3136.000(Ft.)

Difference in elevation = 62.000(Ft.)

Slope = 0.06200 s(%)= 6.20

TC = k(0.469)\*[(length^3)/(elevation change)]^0.2

Initial area time of concentration = 12.963 min.

Rainfall intensity = 5.437(In/Hr) for a 100.0 year storm

Effective runoff coefficient used for area (Q=KCIA) is C = 0.827

Subarea runoff = 11.246(CFS)

Total initial stream area = 2.500(Ac.)

Pervious area fraction = 0.800

Initial area Fm value = 0.438 (In/Hr)

+++++  
Process from Point/Station 22.000 to Point/Station 23.000  
\*\*\*\* IRREGULAR CHANNEL FLOW TRAVEL TIME \*\*\*\*

Depth of flow = 0.284(Ft.), Average velocity = 3.465(Ft/s)  
\*\*\*\*\* Irregular Channel Data \*\*\*\*\*

-----  
Information entered for subchannel number 1 :

Point number	'X' coordinate	'Y' coordinate
1	0.00	2.00
2	10.00	0.00
3	20.00	0.00
4	30.00	2.00

Manning's 'N' friction factor = 0.040

---

Sub-Channel flow = 11.246(CFS)  
     flow top width = 12.842(Ft.)  
     velocity= 3.465(Ft/s)  
     area = 3.246(Sq.Ft)  
     Froude number = 1.215

Upstream point elevation = 3136.000(Ft.)

Downstream point elevation = 3090.000(Ft.)

Flow length = 840.000(Ft.)

Travel time = 4.04 min.

Time of concentration = 17.00 min.

Depth of flow = 0.284(Ft.)

Average velocity = 3.465(Ft/s)

Total irregular channel flow = 11.246(CFS)

Irregular channel normal depth above invert elev. = 0.284(Ft.)

Average velocity of channel(s) = 3.465(Ft/s)

---

Process from Point/Station 22.000 to Point/Station 23.000

## MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service  
Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Mojave Desert Area, West Central Part, California

Survey Area Data: Version 14, Sep 13, 2021

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jun 26, 2019—Jul 8, 2019

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

## Description

A soil map unit is a collection of soil areas or nonsoil areas (miscellaneous areas) delineated in a soil survey. Each map unit is given a name that uniquely identifies the unit in a particular soil survey area.

<sup>1</sup> Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

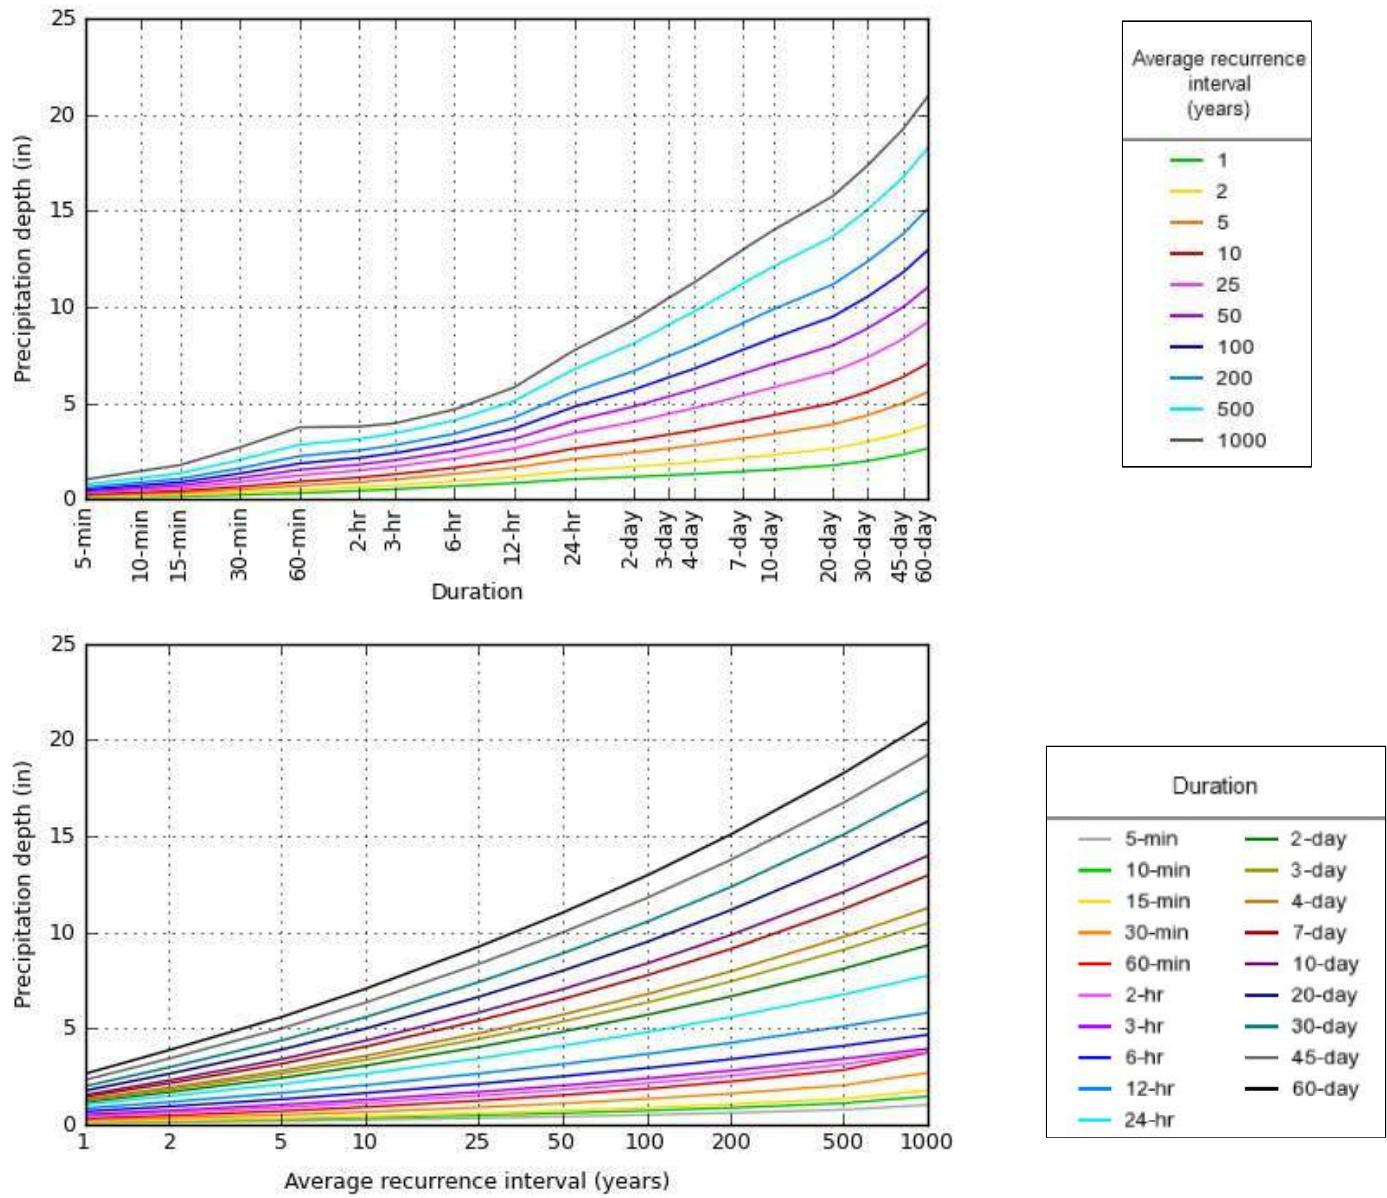

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.
