Type of Study: Reconnaissance Survey
Resources Recorded: None
Keywords: San Bernardino County
USGS Quadrangle: 7.5-minute Phelan, California (1996)

MANAGEMENT SUMMARY

BCR Consulting LLC (BCR Consulting) is under contract to EPD Solutions, Inc. to complete a Cultural Resources Assessment of the proposed Duncan Road Solar Photovoltaic Installation Project (project) in San Bernardino County, California. The main portion of the project occupies 25 acres bounded by railroad tracks on the north, Duncan Road on the south, Greystone Road on the east, and privately held parcels on the west. An offsite project component includes a proposed capacitor located at a small non-contiguous property to the north. A cultural resources records search, reconnaissance-level pedestrian field survey, Native American Consultation, and vertebrate Paleontological Resources Assessment were conducted for the project in partial fulfillment of the California Environmental Quality Act (CEQA). The records search revealed that five cultural resources studies have taken place resulting in the recording of three cultural resources within one mile of the project and proposed offsite impact area. Of the five previous studies, one assessed the main portion of the project resulting in no cultural resources previously recorded within its boundaries. The offsite project area has never previously been surveyed for cultural resources. Native American Consultation results are provided in Appendix A, the Paleontological Resources Assessment is included as Appendix B, and project photographs are provided in Appendix C.

During the field survey, BCR Consulting archaeologists did not discover any cultural resources, including prehistoric or historic archaeological sites or historic buildings, within the project boundaries of within the proposed offsite impact area. As a result BCR Consulting recommends that no additional cultural resources work or monitoring is necessary for proposed project activities. However, if previously undocumented cultural resources are identified during earthmoving activities, a qualified archaeologist shall be contacted to assess the nature and significance of the find, diverting construction excavation if necessary.

If human remains are encountered during the undertaking, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the Native American Heritage Commission (NAHC), which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC.

INTRODUCTION

BCR Consulting LLC (BCR Consulting) is under contract to EPD Solutions, Inc. to complete a Cultural Resources Assessment of the proposed Duncan Road Solar Photovoltaic Installation Project (project) in San Bernardino County, California. A cultural resources records search, reconnaissance-level pedestrian field survey, Native American Consultation, and vertebrate paleontological resources assessment were conducted for the project in partial fulfillment of the California Environmental Quality Act (CEQA). The project involves the development of a solar photovoltaic system. The main portion of the project occupies 25 acres bounded by railroad tracks on the north, Duncan Road on the south, Greystone Road on the east, and privately held parcels on the west. An offsite project component includes a proposed capacitor located at a small non-contiguous property to the north. The project is located in the southeast quarter of Section 36 and the northeast quarter of Section 25, Township 5 North, Range 7 West, San Bernardino Baseline and Meridian. It is depicted on the United States Geological Survey (USGS) *Phelan, California* (1996) 7.5-minute topographic quadrangle (Figure 1).

NATURAL SETTING

Geology

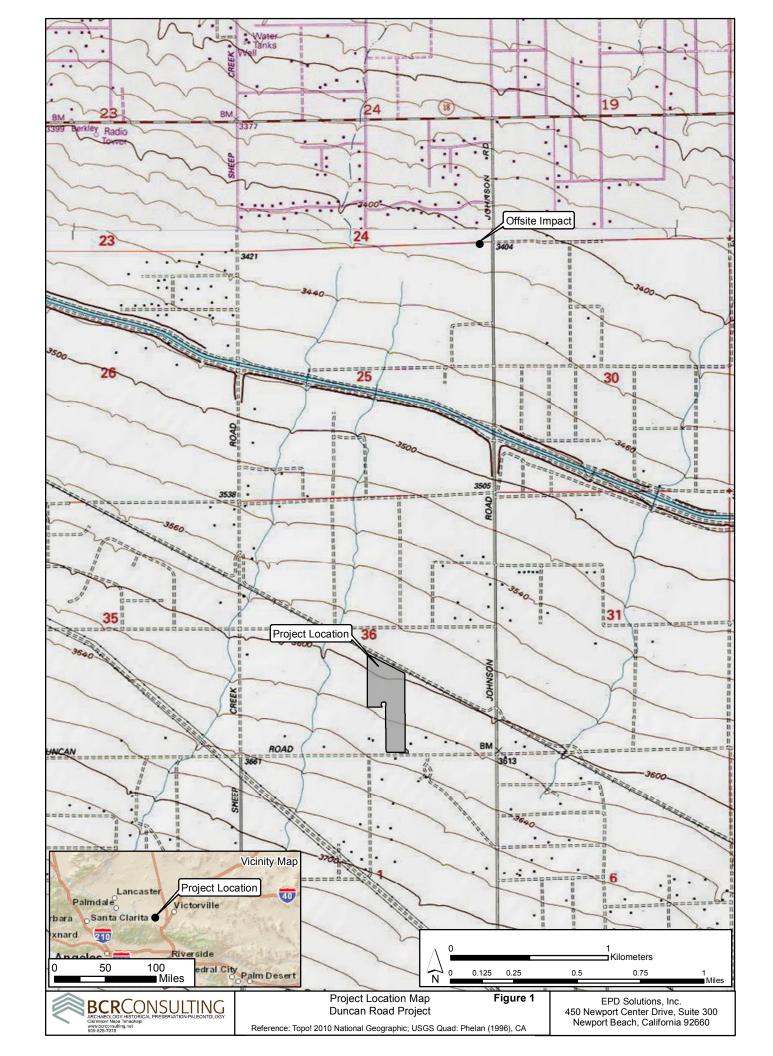

The project is located in the southwestern portion of the Mojave Desert. Sediments within the project boundaries include a geologic unit composed of young alluvial-fan deposits formed during the late Pleistocene and Holocene Epochs of the Quaternary Period (Miller and Matti 2006, Lambert 1994:17). The unit is composed of "slightly consolidated, undissected to slightly dissected deposits of poorly sorted sand and silt containing scattered subangular pebbles" (Miller and Matti 2006). Field observations during the current study are basically consistent with these descriptions, although surface examinations revealed the presence of some granitic and quartz gravel, pebble, and cobble deposits. None of the materials observed during the field survey exhibited evidence of the manufacture or acquisition of prehistoric stone tools or materials.

Hydrology

The project elevation ranges from approximately 3,594 to 3,613 feet above mean sea level (AMSL). Sheetwashing and some rilling occurs from southwest to northeast, although much local water eventually drains into tributaries of Sheep Creek to the west. To the southeast, the peaks of the San Bernardino Mountains rise above 10,000 feet and are often capped with snow until late spring or early summer. The area currently exhibits an arid climate, with dry, hot summers and cool winters. Rainfall ranges from five to 15 inches annually (Jaeger and Smith 1971:36-37). Precipitation usually occurs in the form of winter and spring rain or snow at high elevations, with occasional warm monsoonal showers in late summer.

Biology

The mild climate of the late Pleistocene allowed piñon-juniper woodland to thrive throughout most of the Mojave (Van Devender et al. 1987). The vegetation and climate during that epoch attracted significant numbers of Rancholabrean fauna, including dire wolf, sabertoothed cat, short-faced bear, horse, camel, antelope, mammoth, pelican, goose, duck, cormorant, and eagle (Reynolds 1988). The drier climate of the middle Holocene resulted in the local development of complementary flora and fauna, which remain largely intact to this

day. Common native plants currently include creosote, cacti (various species), rabbit bush, interior golden bush, cheesebush, sage (various species), buckwheat (at high elevations and near drainages), Joshua tree, and seasonal grasses. Common native animals include coyotes, cottontail and jackrabbits, rats, mice, desert tortoises, roadrunners, raptors, turkey vultures, and other bird species (see Williams et al. 2008).

CULTURAL SETTING

Prehistory

The prehistoric cultural setting of the Mojave Desert has been organized into many chronological frameworks (see Warren and Crabtree 1986; Bettinger and Taylor 1974; Lanning 1963; Hunt 1960; Wallace 1958, 1962, 1977; Wallace and Taylor 1978; Campbell and Campbell 1935), although there is no definitive sequence for the region. The difficulties in establishing cultural chronologies for the Mojave are a function of its enormous size and the small amount of archaeological excavations conducted there. Moreover, throughout prehistory many groups have occupied the Mojave and their territories often overlap spatially and chronologically resulting in mixed artifact deposits. Due to dry climate and capricious geological processes, these artifacts rarely become integrated in-situ. Lacking a milieu hospitable to the preservation of cultural midden. Mojave chronologies have relied upon temporally diagnostic artifacts, such as projectile points, presence/absence of other temporal indicators, such as groundstone. Such methods are instructive, but can be limited by prehistoric occupants' concurrent use of different artifact styles, or by artifact re-use or re-sharpening, as well as researchers' mistaken diagnosis, and other factors (see Flenniken 1985; Flenniken and Raymond 1986; Flenniken and Wilke 1989). Recognizing the shortcomings of comparative temporal indicators, this study synthesizes Warren and Crabree (1986), who have drawn upon this method to produce a commonly cited and relatively comprehensive chronology.

Paleoindian (12,000 to 10,000 BP) and Lake Mojave (10,000 to 7,000 BP) Periods. Climatic warming characterizes the transition from the Paleoindian Period to the Lake Mojave Period. This transition also marks the end of Pleistocene Epoch and ushers in the Holocene. The Paleoindian Period has been loosely defined by isolated fluted (such as Clovis) projectile points, dated by their association with similar artifacts discovered in-situ in the Great Plains (Sutton 1996:227-228). Some fluted bifaces have been associated with fossil remains of Rancholabrean mammals approximately dated to ca. 13,300-10,800 BP near China Lake in the northern Mojave Desert. The Lake Mojave Period has been associated with cultural adaptations to moist conditions, and resource allocation pointing to more lacustrine environments than previously (Bedwell 1973; Hester 1973). Artifacts that characterize this period include stemmed points, flake and core scrapers, choppers, hammerstones, and crescentics (Warren and Crabtree 1986:184). Projectile points associated with the period include the Silver Lake and Lake Mojave styles. Lake Mojave sites commonly occur on shorelines of Pleistocene lakes and streams, where geological surfaces of that epoch have been identified (Basgall and Hall 1994:69).

Pinto Period (7,000 to 4,000 BP). The Pinto Period has been largely characterized by desiccation of the Mojave. As formerly rich lacustrine environments began to disappear, the artifact record reveals more sporadic occupation of the Mojave, indicating occupants' recession to the more hospitable fringes (Warren 1984). Pinto Period sites are rare, and are characterized by surface manifestations that usually lack significant in-situ remains. Artifacts from this era include Pinto projectile points and a flake industry similar to the Lake Mojave

tool complex (Warren 1984), though use of Pinto projectile points as an index artifact for the era has been disputed (see Schroth 1994). Milling stones have also occasionally been associated with sites of this period (Warren 1984).

Gypsum Period. (4,000 to 1,500 BP). A temporary return to moister conditions during the Gypsum Period is postulated to have encouraged technological diversification afforded by the relative abundance of resources (Warren 1984:419-420; Warren and Crabtree 1986:189). Lacustrine environments reappear and begin to be exploited during this era (Shutler 1961, 1968). Concurrently a more diverse artifact assemblage reflects intensified reliance on plant resources. The new artifacts include milling stones, mortars, pestles, and a proliferation of Humboldt Concave Base, Gypsum Cave, Elko Eared, and Elko Cornernotched dart points (Warren 1984; Warren and Crabtree 1986). Other artifacts include leaf-shaped projectile points, rectangular-based knives, drills, large scraper planes, choppers, hammer stones, shaft straighteners, incised stone pendants, and drilled slate tubes. The bow and arrow appears around 2,000 BP, evidenced by the presence of a smaller type of projectile point, the Rose Spring point (Rogers 1939; Shutler 1961; Yohe 1992).

Saratoga Springs Period (1,500 to 800 BP). During the Saratoga Springs Period regional cultural diversifications of Gypsum Period developments are evident within the Mojave. Basketmaker III (Anasazi) pottery appears during this period, and has been associated with turquoise mining in the eastern Mojave Desert (Warren and Crabtree 1986:191). Influences from Patayan/Yuman assemblages are apparent in the southern Mojave, and include buff and brown wares often associated with Cottonwood and Desert Side-notched projectile points (Warren 1984:423). Obsidian becomes more commonly used throughout the Mojave and characteristic artifacts of the period include milling stones, mortars, pestles, ceramics, and ornamental and ritual objects. More structured settlement patterns are evidenced by the presence of large villages, and three types of identifiable archaeological sites (major habitation, temporary camps, and processing stations) emerge (McGuire and Hall 1988). Diversity of resource exploitation continues to expand, indicating a much more generalized, somewhat less mobile subsistence strategy.

Shoshonean Period (800 BP to Contact). The Shoshonean period is the first to benefit from contact-era ethnography –as well as be subject to its inherent biases. Interviews of living informants allowed anthropologists to match artifact assemblages and particular traditions with linguistic groups, and plot them geographically (see Kroeber 1925; Gifford 1918; Strong 1929). During the Shoshonean Period continued diversification of site assemblages, and reduced Anasazi influence both coincide with the expansion of Numic (Uto-Aztecan language family) speakers across the Great Basin, Takic (Uto-Aztecan language family) speakers into southern California, and the Hopi across the Southwest (Sutton 1996). Hunting and gathering continued to diversify, and the diagnostic arrow points include desert side-notch and cottonwood triangular. Ceramics continue to proliferate, though are more common in the southern Mojave during this period (Warren and Crabtree 1986). Trade routes have become well established across the Mojave, particularly the Mojave Trail, which transported goods and news across the desert via the Mojave River, to the west of the current project. Trade in the western Mojave was more closely related to coastal groups than others.

Ethnography

The Uto-Aztecan "Serrano" people occupied the western Mojave Desert periphery. Kroeber (1925) applied the generic term "Serrano" to four groups, each with distinct territories: the Kitanemuk, Tataviam, Vanyume, and Serrano. Only one group, in the San Bernardino Mountains and West-Central Mojave Desert, ethnically claims the term Serrano. Bean and Smith (1978) indicate that the Vanyume, an obscure Takic population, was found along the Mojave River at the time of Spanish contact. The Kitanemuk lived to the north and west, while the Tataviam lived to the west. The Serrano lived mainly to the south (Bean and Smith 1978). All may have used the western Mojave area seasonally. Historical records are unclear concerning precise territory and village locations. It is doubtful that any group, except the Vanyume, actually lived in the region for several seasons yearly.

History

Historic-era California is generally divided into three periods: the Spanish or Mission Period (1769 to 1821), the Mexican or Rancho Period (1821 to 1848), and the American Period (1848 to present).

Spanish Period. The first European to pass through the project area is thought to be a Spaniard called Father Francisco Garces. Having become familiar with the area, Garces acted as a guide to Juan Bautista de Anza, who had been commissioned to lead a group across the desert from a Spanish outpost in Arizona to set up quarters at the Mission San Gabriel in 1771 near what today is Pasadena (Beck and Haase 1974). This is the first recorded group crossing of the Mojave Desert and, according to Father Garces' journal, they camped at the headwaters of the Mojave River, one night less than a day's march from the mountains. Today, this is estimated to have been approximately 11 miles southeast of Victorville (Marenczuk 1962). Garces was followed by Alta California Governor Pedro Fages, who briefly explored the western Mojave region in 1772. Searching for San Diego Presidio deserters, Fages had traveled north through Riverside to San Bernardino, crossed over the mountains into the Mojave Desert, and then journeyed westward to the San Joaquin Valley (Beck and Haase 1974).

Mexican Period. In 1821, Mexico overthrew Spanish rule and the missions began to decline. By 1833, the Mexican government passed the Secularization Act, and the missions, reorganized as parish churches, lost their vast land holdings, and released their neophytes (Beattie and Beattie 1974).

American Period. The American Period, 1848–Present, began with the Treaty of Guadalupe Hidalgo. In 1850, California was accepted into the Union of the United States primarily due to the population increase created by the Gold Rush of 1849. The cattle industry reached its greatest prosperity during the first years of the American Period. Mexican Period land grants had created large pastoral estates in California, and demand for beef during the Gold Rush led to a cattle boom that lasted from 1849–1855. However, beginning about 1855, the demand for beef began to decline due to imports of sheep from New Mexico and cattle from the Mississippi and Missouri Valleys. When the beef market collapsed, many California ranchers lost their ranchos through foreclosure. A series of disastrous floods in 1861–1862, followed by a significant drought diminished the economic impact of local ranching. This decline combined with ubiquitous agricultural and real estate developments of the late 19th century, set the stage for diversified economic pursuits that have continued to proliferate to this day (Beattie and Beattie 1974; Cleland 1941).

PERSONNEL

David Brunzell, M.A., RPA acted as the Project Manager and Principal Investigator for the current study. Mr. Brunzell also conducted the cultural resources records search at the San Bernardino Archaeological Information Center (SBAIC) located at the San Bernardino County Museum in Redlands, California. David Brunzell and BCR Consulting Staff Archaeologist/Geographic Information Systems (GIS) specialist Joseph Brunzell completed the field assessment. David Brunzell compiled the technical report, and provided oversight.

METHODS

Research

Prior to fieldwork, a records search was conducted at the SBAIC. This archival research reviewed the status of all recorded historic and prehistoric cultural resources, and survey and excavation reports completed within one mile of the current project. Additional resources reviewed included the National Register of Historic Places, the California Register of Historical Resources, and documents and inventories published by the California Office of Historic Preservation. These include the lists of California Historical Landmarks, California Points of Historical Interest, Listing of National Register Properties, and the Inventory of Historic Structures.

Field Survey

An archaeological field survey of the project was conducted on May 13, 2013 and November 6, 2013. The survey was conducted by walking parallel transects spaced approximately 15 meters apart across 100 percent of the study area, where accessible. Soil exposures were carefully inspected for evidence of cultural resources.

RESULTS

Records Search

Data from the SBAIC revealed that five previous cultural resources studies have taken place resulting in the recording of three cultural resources (all historic-period) within one-mile of the project. The nearest cultural resources was a historic-period transmission alignment located approximately ½ mile south of the main project site. Of the five previous studies, one assessed the main portion of the project resulting in no cultural resources previously recorded within its boundaries. The offsite project area has never previously been surveyed for cultural resources. The records search is summarized as follows:

Table A. Cultural Resources and Reports Within One Mile of the Project Site

USGS 7.5 Minute Quadrangle	Cultural Resources Within One Mile of Project Site	Studies Within One Mile of Project Site
Phelan, California (1996)	CASBR-9940H, P-36-021351, 21619	SB-1061095, 1063779, 1064996, 1065917*, 1066652

^{*}Assessed main project boundaries.

Field Survey

During the field survey, David Brunzell and Joseph Brunzell carefully inspected the project site (including proposed offsite impacts), and identified no cultural resources. Both the main project site and proposed offsite impact area exhibited surface visibility of approximately 60

percent. Ground disturbances were severe, particularly in the central and northwestern portions of the main project site. These have resulted from a variety of natural and artificial factors, including mechanical trenching and excavation, surface erosion, and impacts from off road vehicles.

RECOMMENDATIONS

BCR Consulting conducted a Cultural Resources Assessment of the Duncan Road Solar Photovoltaic Installation Project (including one proposed offsite impact area) in unincorporated San Bernardino County, California. This work was completed pursuant to CEQA. The records search and field survey did not identify any cultural resources (including prehistoric or historic archaeological sites or historic buildings) within the project site or the proposed offsite impact area. Furthermore, records search results combined with surface conditions have failed to indicate sensitivity for buried cultural resources. Based on these results, BCR Consulting recommends that no additional cultural resource work or monitoring is necessary for any earthmoving proposed within the project site or within the proposed offsite impact area. However, if previously undocumented cultural resources are identified during earthmoving activities, a qualified archaeologist should be contacted to assess the nature and significance of the find, diverting construction excavation if necessary.

If human remains are encountered during the undertaking, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the Native American Heritage Commission (NAHC), which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC.

APPENDIX A NATIVE AMERICAN CONSULTATION

Print 4/26/13 6:38 PM

Subject:	Sacred Lands File and List of Tribes/Individuals for the Duncan Road Project, San Bernardino County, California		
From:	joseph brunzell (joebrunzell@gmail.com)		
To:	ds_nahc@pacbell.net;		
Cc:	david.brunzell@yahoo.com;		
Date:	Thursday, April 25, 2013 10:40 PM		

Hi Dave,

I'd like to request a Sacred Lands File search and list of potentially interested tribes for the proposed Duncan Road Project located in San Bernardino County, California. The proposed project is located in Section 36 of Township 5 North, Range 7 West, San Bernardino Baseline and Meridian. It is depicted on the USGS *Phelan*(1996), California 7.5 Minute Topographic Quadrangle (see attached map).*

Please send the list to my email or the below fax number, and please get in touch with any questions.

PLEASE NOTE: BCR CONSULTING HAS A NEW FAX NUMBER (SEE BELOW)!!

Re: Request for Sacred Lands File Search and Native American Contacts list for the "Duncan Road Project;" located in Phelan area; San Bernardino County, California.

Dear Mr. Brunzell:

A record search of the NAHC Sacred Lands File failed to indicate the presence of Native American traditional cultural place(s) in the project site location submitted, based on the USGS coordinates, the Area of Potential Effect (APE). Also, NAHC SLF Inventory is not exhaustive; therefore, the absence of archaeological or Native American sacred places does not preclude their existence. Other data sources for Native American sacred places/sites should also be contacted. A Native American tribe of individual may be the only sources of presence of traditional cultural places or sites.

In the 1985 Appellate Court decision (170 Cal App 3rd 604), the Court held that the NAHC has jurisdiction and special expertise, as a state agency, over affected Native American resources impacted by proposed projects, including archaeological places of religious significance to Native Americans, and to Native American burial sites.

Attached is a list of Native American tribes, individuals/organization who may have knowledge of cultural resources in or near the project area. As part of the consultation process, the NAHC recommends that local governments and project developers contact the tribal governments and individuals to determine if any cultural places might be impacted by the proposed action. If a response is not received in two weeks of notification the NAHC requests that a follow telephone call be made to ensure that the project information ahs been regioned.

If you have any offestions of feed additional information, please contact me at (916)

653-6251. Sincerely,

Dave Singleton

Subject: Tribal Consultation for the Duncan Road Project, San Bernardino County,

California

Dear Joseph:

This is an invitation to consult on a proposed development project at locations with which you have tribal cultural affiliation. The purpose of the consultation is to ensure the protection of Native American cultural resources on which the proposed undertaking may have an impact. In the tribal consultation process, early consultation is encouraged in order to provide for full and reasonable public input from Native American Groups and Individuals, as consulting parties, on potential effect of the development project and to avoid costly delays. Further, we understand that much of the content of the consultation will be confidential and will include, but not be limited to, the relationship of proposed project details to Native American Cultural Historic Properties, such as burial sites, known or unknown, architectural features and artifacts, ceremonial sites, sacred shrines, cultural landscapes including traditional beliefs and practices. The proposed Duncan Road Project site is located within Section 36 of Township 5 North, Range 7 West, San Bernardino Baseline and Meridian, and is depicted on the *Phelan* (1996), *California* USGS 7.5 Minute Topographic Quadrangle (see attached).

If you know of any cultural resources in the vicinity that may be of religious and/or cultural significance to your community or if you would like more information, please contact me at 909-525-7078 or david.brunzell@yahoo.com. Correspondence can also be sent to BCR Consulting, Attn: David Brunzell, 1420 Guadalajara Street, Claremont, California 91711. I request a response by May 15, 2013. If you require more time, please let me know. Thank you for your involvement in this process.

Sincerely,

BCR Consulting

Cc:	Abrierty@SanManuel-NSN.Gov;			
Date:	Wednesday, May 15, 2013 2:50 PM			

David, thank you for the opportunity to provide input on these projects. The results of a records search was not provided so it is difficult to determine what might be known about each of these project areas. We recommend that surveys be completed and that the resulting archaeological survey reports be provided to the Tribe for review. If cultural resources are identified, the Tribe would like that opportunity to provide comment. Thank you.

Regards, //daniel

re: Paleontological resources for the proposed Duncan Road Project, near the community of Phelan, San Bernardino County, project area

Dear Joseph:

I have conducted a thorough check of our paleontology collection records for the locality and specimen data for the proposed Duncan Road Project, near the community of Phelan, San Bernardino County, project area as outlined on the portion of the Phelan topographic quadrangle map that you sent to me via e-mail on 1 May 2013. We do not have any vertebrate fossil localities that lie directly within the proposed project area, but we do have vertebrate fossil localities somewhat in the general vicinity from sedimentary deposits similar to those that occur in the proposed project area.

Surficial deposits in the entire proposed project area consist of younger Quaternary Alluvium, primarily derived as alluvial fan deposits from the San Gabriel Mountains to the south. At relatively shallow depth in this area, however, there are older Quaternary deposits that are exposed in the major drainages. The uppermost layers of the younger Quaternary Alluvium typically do not contain significant vertebrate fossils, but deeper excavations may well encounter terrestrial Late Pleistocene vertebrate fossils such as those found at the Rancho La Brea asphalt deposits in Los Angeles. Our closest vertebrate fossil localities in deposits similar to these occur some miles to the northwest to west-northwest of the proposed project area along Rancho Road / Avenue S from Little Rock east. These localities, LACM 5942-5953, are from pipeline excavations in the Quaternary Alluvium and older Quaternary sediments that produced a fauna of small fossil vertebrates including gopher snake, *Pituophis*, kingsnake, *Lampropeltis*, leopard

lizard, *Gambelia wislizenii*, cottontail rabbit, *Sylvilagus*, pocket mouse, *Chaetodipus*, kangaroo rat, *Dipodomys*, and pocket gopher, *Thomomys*.

Surface grading or very shallow excavations in the uppermost few feet of the younger Quaternary Alluvium exposed in the proposed project area are unlikely to uncover significant vertebrate fossils. Deeper excavations that extend down into older Quaternary deposits, however, may well encounter significant fossil vertebrate remains. Any substantial excavations in the proposed project area, therefore, should be monitored closely to quickly and professionally recover any fossil remains discovered while not impeding development. Note that some of the fossils recovered from the Quaternary deposits west of the proposed project area are very small and can only be detected by screen-washing and picking matrix. We recommend that sediment samples from these deposits be collected and processed to determine their suitability for producing vertebrate microfossils. Any fossils recovered during mitigation should be deposited in an accredited and permanent scientific institution for the benefit of current and future generations.

This records search covers only the vertebrate paleontology records of the Natural History Museum of Los Angeles County. It is not intended to be a thorough paleontological survey of the proposed project area covering other institutional records, a literature survey, or any potential on-site survey.

Sincerely,

Samuel A. McLeod, Ph.D. Vertebrate Paleontology

Summel A. M. Leod
