1.0 INTRODUCTION

1.1 Purpose of Analysis and Study Objectives

This Health Risk Assessment has been completed to determine the potential cancer and non-cancer (acute and chronic) risks as well as to determine if local concentrations of criteria pollutants would exceed state and federal standards from the diesel emission sources associated with the operation of the proposed Chevron Convenience Store and Service Station project (proposed project). The following is provided in this report:

- A description of the proposed project;
- A description of toxic air contaminants (TAC);
- A description of the regulatory setting of TACs;
- A description of TAC standards;
- An analysis of TAC concentrations created from operation of the proposed project; and
- A comparison of the calculated cancer and acute non-cancer risks with the SCAQMD thresholds.

1.2 Site Location and Study Area

The project site is located at 10598 Cedar Avenue in the town of Bloomington which is an unincorporated portion of San Bernardino County (County). The approximately 4.39-acre project site is currently developed with an approximately 6,300 square foot building and associated parking lot on the northern 1.89 acres of the project site. The project site is bounded by Slover Avenue and commercial uses to the north, Cedar Avenue and single-family homes to the east, vacant land and commercial uses to the south, and single-family homes and Valencia Street to the west. The project study area is shown in Figure 1.

1.3 Proposed Project Description

The proposed project would consist of the development of a 13-vehicle fueling position gas station with two canopies that total 4,052 square feet, a 5,812 square foot convenience market with a quick serve restaurant (QSR) and a 49-space parking lot located on the northern 1.89 acres of the project site. The remainder portion of the project site (approximately 2.46 acres) would not be developed as part of the proposed project. The proposed site plan is shown in Figure 2.

1.4 Sensitive Receptors

Individuals who are more sensitive to toxic exposures than the general population are considered sensitive receptors. This would include children, the elderly, and persons with preexisting respiratory or cardiovascular illness. Such receptors may reside at hospitals, residences, convalescent facilities, and schools. The nearest offsite sensitive receptors to the project site consist of single-family homes located as near as 10 feet west of the project site, 310 feet east of the project site, and 120 feet north of the project site. In addition, the nearest structure for Bloomington Junior High School/Slover Mountain High School is located as near as 450 feet northeast of the project site.

1.5 Atmospheric Setting

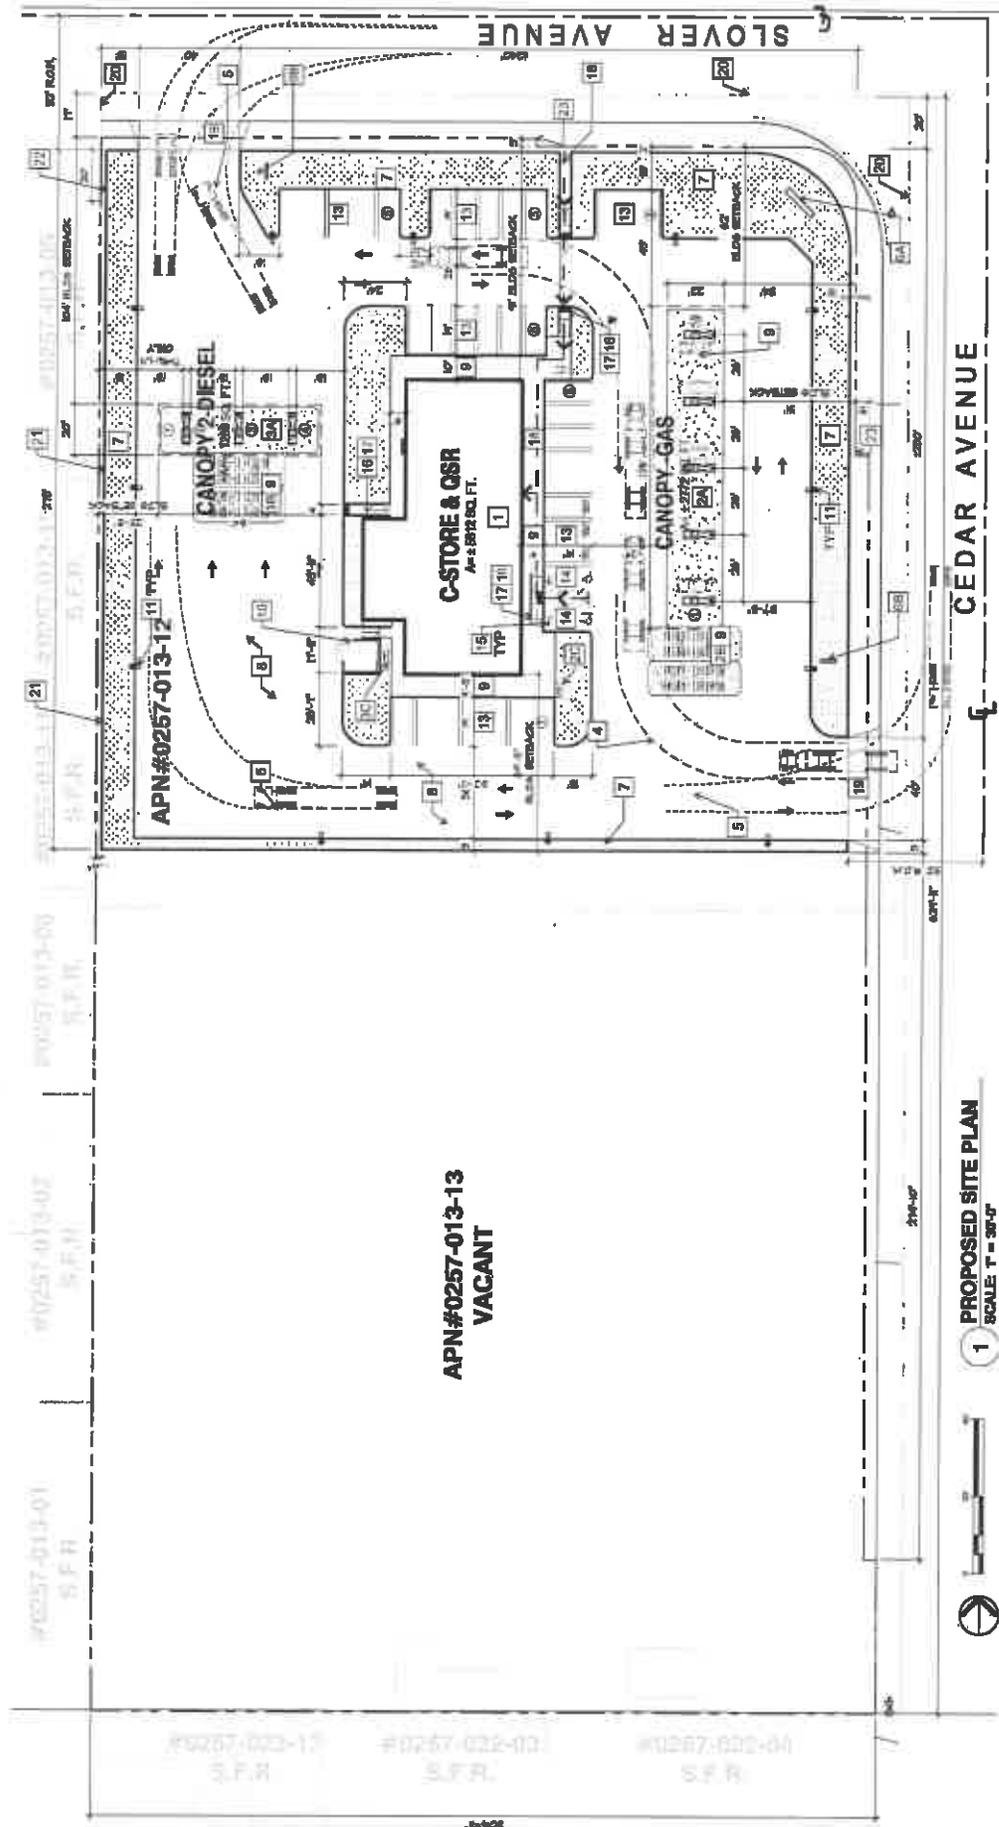

The project site is located within the southern portion of San Bernardino County, which is part of the South Coast Air Basin (Air Basin) that includes all of Orange County as well as the non-desert portions of

Los Angeles, Riverside, and San Bernardino Counties. The Air Basin is regulated by the South Coast Air Quality Management District (SCAQMD).

The Air Basin is located on a coastal plain and is bounded by the Pacific Ocean to the southwest and high mountains to the east forming the inland perimeter. The climate is Southern California's Mediterranean-type climate, which is characterized by hot dry summers, mild moist winters with infrequent rainfall, moderate afternoon breezes, and generally fair weather. Strong temperature inversions are more common during the summer. It is not uncommon to see temperatures above 90 degrees Fahrenheit during the period from August to September.

2.0 TOXIC AIR CONTAMINANTS

Toxic air contaminants (TACs) is a term that is defined under the California Clean Air Act and consists of the same substances that are defined as Hazardous Air Pollutants (HAPs) in the Federal Clean Air Act. There are over 700 hundred different types of TACs with varying degrees of toxicity. Sources of TACs include industrial processes such as petroleum refining and chrome plating operations, commercial operations such as gasoline stations and dry cleaners, and motor vehicle exhaust. Cars and trucks release at least 40 different toxic air contaminants. The most important of these TACs, in terms of health risk, are diesel particulates, benzene, formaldehyde, 1,3-butadiene, and acetaldehyde. Public exposure to TACs can result from emissions from normal operations as well as from accidental releases. Health effects of TACs include cancer, birth defects, neurological damage, and death.

2.1 Diesel Particulate Matter

According to *The California Almanac of Emissions and Air Quality 2013 Edition*, the majority of the estimated health risk from TACs can be attributed to relatively few compounds, the most important of which is diesel particulate matter (DPM). DPM is a subset of PM_{2.5} because the size of diesel particles are typically 2.5 microns and smaller. The identification of DPM as a TAC in 1998 led the California Air Resources Board (CARB) to adopt the Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-fueled Engines and Vehicles in September 2000. The plan's goals are a 75-percent reduction in DPM by 2010 and an 85-percent reduction by 2020 from the 2000 baseline. Diesel engines emit a complex mixture of air pollutants, composed of gaseous and solid material. The visible emissions in diesel exhaust are known as particulate matter or PM, which includes carbon particles or "soot." Diesel exhaust also contains a variety of harmful gases and over 40 other cancer-causing substances. California's identification of DPM as a toxic air contaminant was based on its potential to cause cancer, premature deaths, and other health problems. Exposure to DPM is a health hazard, particularly to children whose lungs are still developing and the elderly who may have other serious health problems. Overall, diesel engine emissions are responsible for the majority of California's potential airborne cancer risk from combustion sources. The various pollutants within DPM that also cause acute and chronic health impacts are detailed below in Table A. Table A was developed through crosschecking all diesel emissions pollutants provided in San Diego Air Pollution Control District's (SDAPCD) Diesel Fired Engines Emissions Factor Table to the list of acute and chronic reference exposure levels provided at: <http://oehha.ca.gov/air/allrels.html>.

Table A – Diesel Emission Pollutants that Cause Acute and Chronic Health Impacts

| TAC | TAC Potency Factors ($\mu\text{g}/\text{m}^3$) ¹ | | Percent of DPM Emission Rate ³ | Target Organ Systems |
|-----------------------|---|-------------|---|---|
| | Acute REL ² | Chronic REL | | |
| 1,3-Butadiene | 660 | 140 | 0.51% | Development |
| Acetaldehyde | 470 | 140 | 1.84% | Eyes, respiratory system (sensory irritation) |
| Acrolein | 2.5 | 0.35 | 0.08% | Eyes, respiratory system |
| Arsenic | 0.2 | 0.015 | 0.004% | Reproductive/developmental, cardiovascular system, nervous system |
| Benzene | 27 | 3 | 0.44% | Hematologic system, immune system, reproductive/developmental |
| Cadmium | -- | 0.02 | 0.004% | kidney, respiratory system |
| Chlorobenzene | -- | 1,000 | 0.0005% | Eyes, respiratory system |
| Chromium (hexavalent) | -- | 0.2 | 0.001% | Respiratory system, hematologic system |
| Copper | 100 | -- | 0.01% | Respiratory system |

| TAC | TAC Potency Factors ($\mu\text{g}/\text{m}^3$) ¹ | | Percent of DPM Emission Rate ³ | Target Organ Systems |
|-------------------|---|-------------|---|--|
| | Acute REL ² | Chronic REL | | |
| Ethyl benzene | -- | 5 | 0.03% | Liver, kidney, developmental |
| Formaldehyde | 55 | 9 | 4.07% | Eyes, immune system, respiratory |
| Hexane | -- | 200 | 0.06% | Nervous system |
| Hydrogen Chloride | 2,100 | 9 | 0.44% | Eyes, respiratory system |
| Manganese | -- | 0.09 | 0.01% | Nervous system |
| Mercury | 0.6 | 0.03 | 0.005% | Reproductive/developmental |
| Naphthalene | -- | 9 | 0.05% | Respiratory system |
| Nickel | 0.2 | 002 | 0.01% | Immune system, respiratory system |
| Propylene | -- | 3000 | 1.10% | Respiratory System |
| Selenium | -- | 20 | 0.01% | Liver, cardiovascular system, nervous system |
| Toluene | 37000 | 300 | 0.25% | Nervous system, eyes, respiratory system, reproductive/developmental |
| Xylene | 22000 | 700 | 0.10% | Eyes, nervous and respiratory systems |
| DPM | -- | 5 | -- | Respiratory system |

² REL = Reference Exposure Level

³ Percentage of DPM Emission Rate calculated by dividing the pollutant's pounds per 1,000 gallons rate by the PM2.5 pounds per 1,000 gallons rate provided by the SDAPCD

Sources: SDAPCD, 2011 and OEHHA, 2014.

2.2 Gasoline Emissions

CARB staff has evaluated the potential cancer risk levels caused by the use of gasoline and their findings are shown in Table B. Table B shows the emissions of four major compounds of gasoline exhaust in the year 2005 for their study area (CARB, 2008). As indicated in Table B, the cancer potency weighted emissions of these four TACs from all types of gasoline sources are estimated at 481 tons per year. For gasoline vehicle sources, the potency weighted emissions of these four TACs are estimated at about 253 tons per year, or about 6 percent of the potency of diesel emissions.

Table B – TAC Emissions from Gasoline Exhaust

| Toxic Air Contaminant | Emissions (tons per year) | | | |
|---|---------------------------|-------------------------------|----------------------------|------------------|
| | All Sources | Potency Weighted ¹ | Gasoline Vehicular Sources | Potency Weighted |
| 1,3-Butadiene | 414 | 228 | 245 | 135 |
| Benzene | 1,997 | 180 | 1,153 | 104 |
| Formaldehyde | 3,208 | 61 | 605 | 12 |
| Acetaldehyde | 1,355 | 12 | 177 | 2 |
| Total (other than DPM) | 6,974 | 481 | 2,180 | 253 |
| Diesel PM | 4,552 | 4,552 | -- | -- |
| Ratio of Gasoline Vehicular Sources to DPM Potency Weight | | | | 0.06 |

Note:

¹ Based on cancer potency weighting factors.

2.3 Asbestos

Asbestos is listed as a TAC by CARB and as a Hazardous Air Pollutant by the EPA. Asbestos occurs naturally in mineral formations and crushing or breaking these rocks, through construction or other means, can release asbestiform fibers into the air. Asbestos emissions can result from the sale or use of asbestos-containing materials, road surfacing with such materials, grading activities, and surface mining. The risk of disease is dependent upon the intensity and duration of exposure. When inhaled, asbestos fibers may remain in the lungs and with time may be linked to such diseases as asbestosis, lung cancer, and mesothelioma. The nearest likely locations of naturally occurring asbestos, as identified in the *General Location Guide for Ultramafic Rocks in California*, prepared by the California Division of Mines and Geology, is located in Santa Barbara County. The nearest historic asbestos mine to the project site, as identified in the *Reported Historic Asbestos Mines, Historic Asbestos Prospects, and Other Natural Occurrences of Asbestos in California*, prepared by U.S. Geological Survey, is located at Asbestos Mountain, which is approximately 62 miles northwest of the project site in the San Jacinto Mountains. Due to the distance to the nearest natural occurrences of asbestos, the project site is not likely to contain asbestos.

3.0 REGULATORY SETTING

The TACs emissions from the proposed project are addressed through the efforts of various federal, state, regional, and local government agencies. These agencies work jointly, as well as individually, to reduce TACs through legislation, regulations, planning, policy-making, education, and a variety of programs. The agencies responsible for improving TACs are discussed below.

Federal and State

The United States Environmental Protection Agency (EPA) is responsible for setting and enforcing the National Ambient Air Quality Standards (NAAQS) for atmospheric pollutants. There are national standards for six common "criteria" air pollutants including ozone, nitrogen dioxide, carbon monoxide, particulate matter (PM₁₀ and PM_{2.5}), lead, and sulfur dioxide, which were identified from provisions of the Clean Air Act of 1970. California, under the California Clean Air Act, has also defined a set of health protective California Ambient Air Quality Standards (CAAQS).

Besides the "criteria" air pollutants, there is another group of substances found in ambient air referred as Hazardous Air Pollutants (HAPs) under the Federal Clean Air Act and Toxic Air Contaminants (TACs) under the California Clean Air Act. These contaminants tend to be localized to their sources and are found in relatively low concentrations in ambient air. They are regulated at the federal, state and regional levels, due to their potential of causing adverse health effects from exposure to low concentrations for long periods of time. HAPs are the air contaminants identified by the EPA as known or suspected to cause cancer, serious illness, birth defects, or death. Many of the contaminants originate from human activities, such as fuel combustion and solvent use. Mobile Source Air Toxics (MSATs) are a subset of the 188 identified HAPs. Of the 21 different HAPs that constitute the MSATs, there are six primary HAPs identified that include diesel exhaust, benzene, formaldehyde, acetaldehyde, acrolein, and 1, 3-butadiene. While vehicle miles traveled in the United States is anticipated to increase by 64 percent between 2000 and 2020, emissions of MSATs are anticipated to decrease between 57 and 67 percent as a result of efforts to control mobile source emissions.

The CARB Statewide comprehensive air toxics program was established in the early 1980s. The TAC Identification and Control Act (Assembly Bill 1807, Tanner 1983 [AB 1807]) created California's program to reduce exposure to air toxics. The Air Toxics "Hot Spots" Information and Assessment Act (Assembly Bill 2588, Connelly 1987 [AB 2588]) supplements the AB 1807 program by requiring a statewide air toxics inventory, notification of people exposed to a significant health risk, and facility plans to reduce these risks.

AB 1807, requires the CARB to identify and control TACs. In selecting substances, the CARB must consider "the risk of harm to the public health, amount or potential amount of emissions, manner of, and exposure to, usage of the substance in California, persistence in the atmosphere, and ambient concentrations in the community." AB 1807 also requires the CARB to use available information gathered from the AB 2588 program to include in the prioritization of compounds. In 1992, the Hot Spots Act was amended by Senate Bill 1731, to require facilities that pose a significant health risk to reduce their risk through a risk management plan.

In 2000, the CARB approved a comprehensive Diesel Risk Reduction Plan to reduce diesel emissions from both new and existing diesel-fueled engines and vehicles. The goal of the plan is to reduce PM emissions and the associated health risks by 75 percent by 2010 and 85 percent by 2020. The plan provides a roadmap that identifies steps CARB will be taking to develop specific regulations to reduce diesel particulate matter (DPM) emissions.

As a result of controls on motor vehicles, fuels, stationary sources, and consumer products, the public's exposure to air toxics has decreased dramatically. Between the early 1990's and today, the decrease in statewide average health risk ranged from approximately 20 percent from formaldehyde to approximately 90 for perchlorethylene. 1,3-butadiene and benzene have also seen significant decreases of 80 to 85 percent as a result of CARB's mobile source control program. In addition dioxins have been reduced by 99 percent in that time period, however that is primarily due to CARB's restrictions on medical waste incinerators.

CCR Title 13. Section 2025 - On-Road Diesel Truck Fleets

On December 12, 2008 the CARB adopted Resolution 08-43, which limits NOx, PM10 and PM2.5 emissions from on-road diesel truck fleets that operate in California. On October 12, 2009 Executive Order R-09-010 was adopted that codified Resolution 08-43 into Section 2025, title 13 of the California Code of Regulations. This regulation requires that by the year 2023 all commercial diesel trucks that operate in California shall meet model year 2010 (Tier 4 Final or Tier 4f) or latter emission standards. In the interim period, this regulation provides annual interim targets for fleet owners to meet. By January 1, 2017, 80 percent of a truck fleet is required to have installed Best Available Control Technology (BACT) for NOx emissions and 100 percent of a truck fleet installed BACT for PM10 emissions. This regulation also provides a few exemptions including a delayed implementation rate for truck fleets of three or fewer trucks, exemptions for agricultural trucks that drive less than 1,000 miles per year, and a onetime per year 3-day pass for trucks registered outside of California. All diesel trucks that utilize public roads in California are required to comply with CCR Title 13, Section 2025.

CCR Title 13. Section 2485 - Commercial Vehicle Idling and Auxiliary Power Systems

On October 20, 2005 the CARB approved regulatory measures including the adoption of Title 13, Chapter 9, Article 8, Section 2485 of the California Code of Regulations (CCR) (Section 2485), which regulates idling activities and auxiliary power systems (APS) in commercial vehicle vehicles with a vehicle weight rating of greater than 10,000 pounds. On December 5, 2014, the OAL approved new Amendments Section 2485, which became effective on January 1, 2015, and now all APS systems operated in California are required to meet the model year 2007 or newer emissions standards and all new APS systems are required to meet the Tier 4f emission standards and by 2023 all APS systems operating in California will be required to meet the Tier 4f emissions standards. Section 2485 also restricts vehicle idling to no more than five minutes at any one location and restricts the operation of an APS to no more than five minutes in any location within 100 feet of a sensitive receptor.

Regional

The South Coast Air Quality Management District (SCAQMD) is the agency principally responsible for comprehensive air pollution control for the South Coast Air Basin (Air Basin). The SCAQMD is responsible for regulating emissions primarily from stationary sources and certain areawide and indirect sources but as no authority over motor vehicle emissions and other non-stationary sources of TAC emissions. To that end, as a regional agency, the SCAQMD works directly with the Southern California Association of Governments (SCAG), county transportation commissions, and local governments and cooperates actively with all federal and state agencies. The SCAQMD with coordination of SCAG is also responsible for developing, updating and implementing the Air Quality Plans for the Air Basin. In addition, the SCAQMD has prepared the Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis, August 2003, which sets forth recommended thresholds of significance, analysis methodologies, and provides guidance on mitigating significant TAC impacts.

In order to determine the Air Basin-wide risks associated with major airborne carcinogens, the SCAQMD conducted the Multiple Air Toxics Exposure Study (MATES) studies. According to the SCAQMD's MATES-IV study, the project site has an estimated cancer risk of 772 per million persons chance of cancer. In comparison, the average cancer risk for the Air Basin is 991 per million persons, which is based on the use of age-sensitivity factors detailed in the OEHHA Guidelines (OEHHA, 2015).

In order to provide a perspective of risk, it is often estimated that the incidence in cancer over a lifetime for the U.S. population ranges between 1 in 3 to 4 and 1 in 3, or a risk of about 300,000 per million persons. The MATES-III study referenced a Harvard Report on Cancer Prevention, which estimated that of cancers associated with known risk factors, about 30 percent were related to tobacco, about 30 percent were related to diet and obesity, and about 2 percent were associated with environmental pollution related exposures that includes hazardous air pollutants.

4.0 MODELING PARAMETERS AND ASSUMPTIONS

The dispersion modeling utilized for analyzing both the TAC emissions and criteria pollutant emissions in this analysis has been based on the recommended methodology described in *Emission Inventory Risk Assessment Guidelines for Gasoline Dispensing Stations*, prepared by SCAQMD, January 2007, and *Air Toxics Hot Spots Program Risk Assessment Guidelines* (OEHHA Guidelines), prepared by Office of Environmental Health Hazard, February 2015. Important issues that affect the dispersion modeling include the following: 1) Model Selection, 2) Source Treatment, 3) Meteorological Data, and 4) Receptor Grid. Each of these issues are addressed below.

4.1 Model Selection

The AERMOD View Version 9.3.0 Model was used for all dispersion modeling. Key dispersion modeling options selected include the regulatory default option and urban modeling option for San Bernardino County with a population of 2,015,355. Flagpole receptor height was set to 0 meters. AERMAP was run with a 7.5 minute USGS DEM Map of Fontana.

Meteorological Data

Meteorological data from SCAQMD's Fontana monitoring site was selected for this modeling application. Five full years of sequential meteorological data was collected at the Fontana Monitoring Station that included 2008, 2009, 2010, 2011, and 2012. The SCAQMD processed the data for input to the model. The data was obtained at: <http://www.aqmd.gov/home/library/air-quality-data-studies/meteorological-data/aermod-table-1>

Receptor Grid

The nearest sensitive receptors that may be impacted by the proposed project are single-family homes located approximately 10 feet west of the project site, 310 feet east of the project site, and 120 feet north of the project site. In addition, the nearest structure for Bloomington Junior High School/Slover Mountain High School is located approximately 450 feet northeast of the project site.

Discrete receptors were placed at eight of the nearest offsite single-family homes and at the nearest school and fence line grid receptors were used out to 500 meters (1,640 feet). Figure 3 shows the locations of the sources and receptors modeled in the AERMOD model.

4.2 Emissions Assumptions

The proposed project would consist of the development of a 13-fueling position gas station and a 5,812 square foot convenience store and quick serve restaurant (QSR). Operational hours are anticipated to be 24-hours per day, 7 days per week with operation expected to start in 2017. The proposed project is anticipated to generate TAC emissions from diesel vehicle operations and from gasoline fuel dispensing activities, which are discussed separately below.

Project-Related Diesel Vehicle Emissions

The project-related diesel vehicle emissions have been analyzed separately for diesel vehicle running emissions and vehicle idling emissions.

Diesel Vehicle Running Emissions

The diesel vehicle emissions created by the vehicle trips generated by the proposed project on the project site and on Cedar Avenue and Slover Avenue within a quarter mile of the project site have been

calculated through use of the vehicle trip rates provided in the *Proposed Chevron Convenience Store and Service Station Traffic Impact Study* (Traffic Impact Study), prepared by RK Engineering Group, Inc., October 2016, which found that the proposed project would generate 2,116 daily vehicle trips. Since three of the 13 proposed fuel pumps are diesel, it has been assumed that 3/13 of the project generated vehicle trips or 488 daily vehicles trips would be diesel powered.

In order to determine the vehicle mix (percentage of non-trucks and trucks) the CalEEMod default vehicle mix was utilized. The traffic volumes utilized in this analysis along with the vehicles mixes are shown in Table C.

Table C – Project Generated Average Daily Traffic Volumes and Vehicle Mixes

| Roadway ² | Road Segment | All Vehicles (ADT) | | | Diesel Vehicles (ADT) ¹ | | |
|----------------------|---------------------|-------------------------|---------------|--------------|------------------------------------|---------------|--------------|
| | | Non-Trucks ³ | Medium Trucks | Heavy Trucks | Non-Trucks ³ | Medium Trucks | Heavy Trucks |
| Cedar Avenue | North of Slover Ave | 760 | 36 | 51 | 175 | 8 | 12 |
| Cedar Avenue | South of Slover Ave | 380 | 18 | 25 | 88 | 4 | 6 |
| Slover Avenue | West of Cedar Ave | 380 | 18 | 25 | 88 | 4 | 6 |
| Slover Avenue | East of Cedar Ave | 380 | 18 | 25 | 88 | 4 | 6 |
| Onsite ⁴ | | 950 | 45 | 64 | 219 | 10 | 15 |

Notes:

¹ Diesel vehicle trips based on ratio of diesel to gasoline fuel pumps (3/13).

² ADTs obtained from Traffic Impact Study (RK Engineering Group, Inc., 2016). Vehicle mix obtained from CalEEMod default mix.

³ Non-Trucks include light auto, light trucks, medium trucks, buses, motorcycles, and motor homes.

⁴ Since the line volume source for the Onsite Roadway models both inbound and outbound trips, the ADT was divided by two.

Cancer Risk Emissions Factors

Since, cancer risk is determined over three exposure time periods (the third trimester of a pregnancy to 2 years of age, 2 to 16 years, and 16 to 30 years) mobile source emissions were calculated based on the annual average emission factors from different model years for each of the three time exposure periods associated with evaluating exposures to residential populations. The proposed project expects an initial occupancy in 2017. Therefore, for the assessment of health risks to sensitive/residential receptors, the DPM emissions factors derived from the CARB EMFAC model as diesel PM10 were developed as an average of truck fleet emission factors from the Project's initial occupancy year of 2017 to 2019, 2020 to 2034, and 2035 to 2046. This averaging of emissions takes into account the fact that emissions from diesel vehicles are expected to significantly decline in future years as a result of vehicle turnover and implementation of existing mobile source emission control rules in place from the CARB. The vehicle speeds for each class of vehicle were based on the posted speed limits onsite and offsite on Cedar Avenue and Slover Avenue. The cancer risk PM10 emission factors assumed in the assessment are shown in Table D and the EMFAC2014 model printouts are provided in Appendix A.

Table D – EMFAC2014 DPM Emission Rates

| Vehicle Class | Speed (mph) | EMFAC2014 PM10 Running Emissions Rates (grams/mile) | | |
|--|-------------|---|-----------|-----------|
| | | 2017-2019 | 2020-2034 | 2035-2046 |
| Onsite | | | | |
| Non-Trucks | 5 | 0.1121 | 0.0308 | 0.0045 |
| Truck 1 | 5 | 0.1041 | 0.0559 | 0.0194 |

In order to simplify the modeling, the non-trucks, Trucks 1, and Trucks 2 PM10 emissions from all analyzed roadway segments were combined and analyzed as a single line volume source in AERMOD. The line volume source for Cedar Avenue north of Slover Avenue was modeled with a 48 foot (15 meter) width, Cedar Avenue south of Slover Avenue was modeled with a 56 foot (17 meter) width, and Slover Avenue was modeled with a 47 foot (14 meter) width, which are the distances between the outside lanes. The onsite roadways were modeled with a 12 foot (3.7 meter) width. All roadways were modeled with a 6-foot (1.8 meter) height. The cancer PM10 emission rates entered into the AERMOD model are shown below in Table E.

Notes:

¹ Diesel Vehicles Daily Trips obtained from Table C above.

² Emission Rates calculated by converting the EMFAC emissions factors to grams per second and multiplying by percent running time (time of travel for one vehicle across roadway * daily vehicle trips / 24 hours)

Non-Cancer (Acute and Chronic) Risk Emissions Factors

Since the non-cancer acute and chronic exposure time periods range from one hour to over one year, the opening year 2017 emissions rates were utilized from the EMFAC2014 model. The non-cancer risk benzene emission factors assumed in the assessment are detailed in Appendix B and shows that for Cedar Avenue and Slover Avenue non-trucks create 0.0294 grams per mile, Trucks 1 create 0.0235 grams per mile, and Trucks 2 create 0.0549 grams per mile. For onsite roadways, non-trucks create 0.1392 grams per mile, Trucks 1 create 0.1099 grams per mile, and Trucks 2 create 0.1572 grams per mile. All other parameters were the same as what were used for the cancer risk emissions factors and the results. The non-cancer benzene emission rates entered into the AERMOD model are shown below in Table F.

Notes:

¹ Diesel Vehicles Daily Trips obtained from Table C above.

² Emission Rates calculated by converting the EMFAC emissions factors to grams per second and multiplying by percent running time (time of travel for one vehicle across roadway * daily vehicle trips / 24 hours)

Onsite Diesel Vehicle Idling

The onsite diesel vehicle idling was modeled as one point source located at the central area of the diesel fuel pumps. The Traffic Impact Study found that the proposed project would generate 2,116 daily vehicle trips and also found that three of the 13 proposed fuel pumps are diesel. Since three of the 13 proposed fuel pumps are diesel, the onsite diesel vehicle idling analysis was based on 3/13 of the daily project generated vehicle trips or 488 daily vehicle trips.

The emissions factor used for the truck idling point source was based on the EMFAC2014 model run that was detailed above for the onsite truck travel emissions and is shown in Appendix A. The idling emission rates utilized in this analysis are shown in Table G that was calculated based on converting the EMFAC emissions rates from grams per hour to grams per second and then multiplying by the daily vehicle trips by five minutes. Since each trip accounts for travel to or from the proposed gas station, this provides a conservative analysis based on 10 minutes of idling onsite per fueling of a vehicle and is consistent with CCR Section 2485 which restricts truck idling to no more than five minutes at any one location. The idling point source was modeled with a 12.6 foot (3.8 meter) height, a 0.1 meter diameter stack, a velocity of 51.71 meters per second, and a temperature of 366 K.

Project-Related Gas Station Emissions

The proposed project will include the development of a gas station on 1.89-acres of the project site. The proposed gas station is anticipated to sell 2,500 gallons of gasoline per day, which is based on a typical rate for gas stations with 10 fueling stations. This would result in 912,500 gallons of gasoline sold at the proposed gas station each year. Gasoline fumes released from gasoline dispensing facilities include several TAC pollutants, of which the predominant is benzene, followed by toluene and xylene. According to *Emission Inventory and Risk Assessment Guidelines for Gasoline Dispensing Stations* (SCAQMD Gas Station Guidelines), prepared by SCAQMD in January 2007, “not until the benzene concentrations are more than two orders of magnitude above the 10 per million cancer risk threshold, do the emissions of toluene and xylene begin to cause adverse health effects.” Therefore, this analysis has been limited to calculating only the benzene emissions.

Analyses of health risks from gas station emissions modeling parameters were based on the SCAQMD Gas Station Guidelines, which found that gas stations emissions are primarily from loading of gasoline, tank breathing, refueling, and spillage. The SCAQMD Guidelines provide benzene emission factors from gas station activities are shown in Table H. Table H also shows the calculated benzene emissions rate in grams per second, based on a gas station with a throughput of 912,500 gallons per year that operates 24-hours per day, 365 days a year. In order to simplify the analysis, the benzene emissions were converted to DPM equivalent emissions. The conversion was based on a ratio of the cancer potency factor of 0.1 for benzene to the cancer potency factor of DPM of 1.1.

Table H – Proposed Gas Station TAC Emissions

| Activity | Emission Factors ¹ (pounds/1,000 gallons) | | Proposed Gas Station Emissions (grams/second) ¹ | |
|--|---|---------|---|--|
| | Gasoline | Benzene | Benzene | Benzene DPM Equivalent ² |
| Loading | 0.42 | 0.00126 | 3.65E-08 | 3.31E-06 |
| Tank Breathing | 0.025 | 0.00075 | 2.17E-09 | 1.97E-10 |
| Combined Loading and Tank Breathing | | | 3.86E-08 | 3.51E-09 |
| Refueling | 0.32 | 0.00096 | 2.78E-08 | 2.53E-09 |
| Spillage | 0.42 | 0.0042 | 1.22E-07 | 1.10E-05 |
| Combined Refueling and Spillage | | | 1.49E-07 | 1.36E-08 |

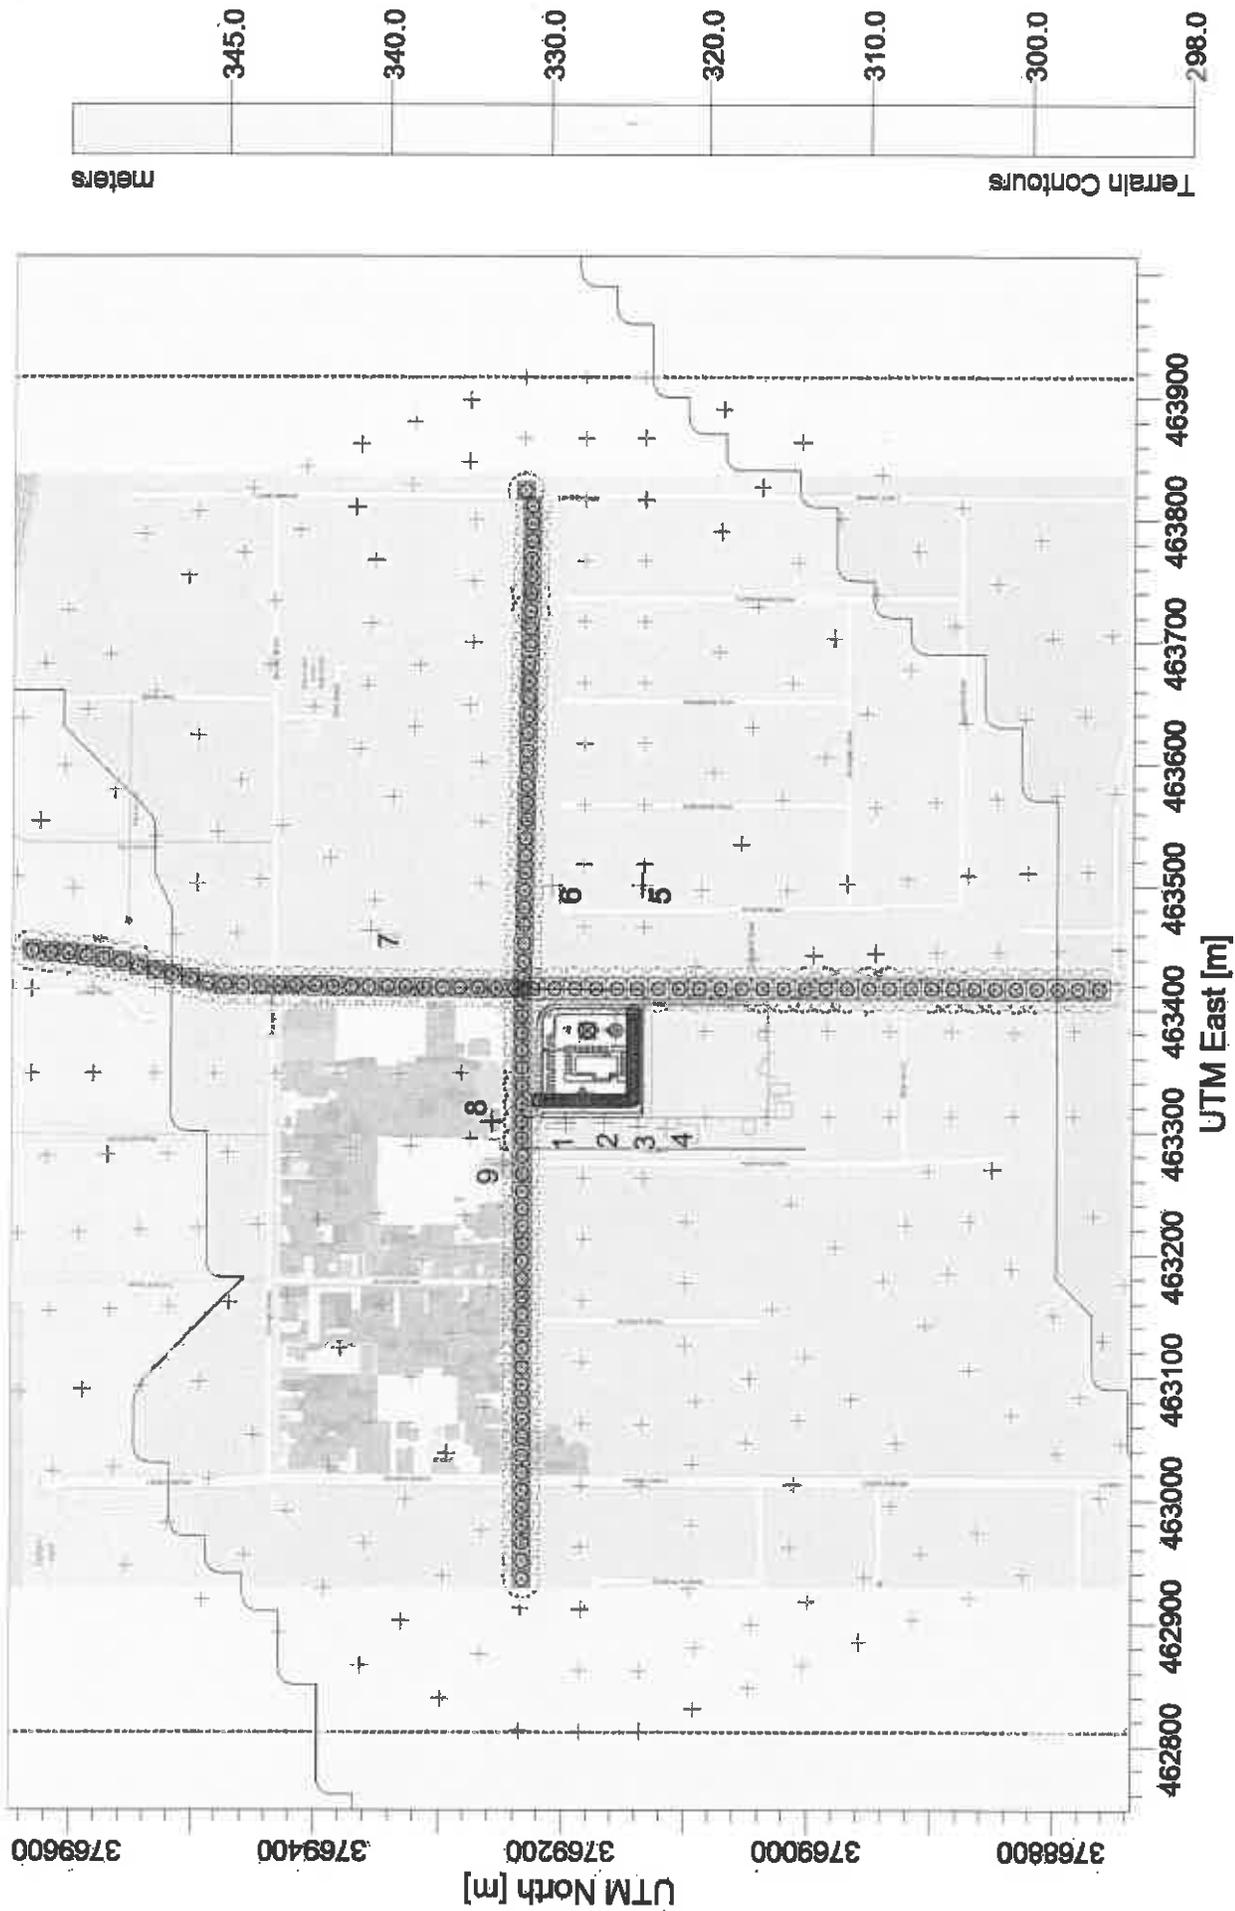

Note:

¹ Proposed gas station emissions based on 912,500 gallons of gasoline per year and operational 24-hours per day, 365 days per year.

² Benzene DPM Equivalent based on the ratio between the cancer potency factors of 0.1 for benzene and 1.1 for DPM.

Source: SCAQMD, 2007.

The loading and tank breathing emissions from the proposed gas station were modeled in the AERMOD model as a point source located at the approximate location of the proposed tanks with a release height of 12 feet (3.6 meters), a gas exit temperature of 294°K, a stack inside diameter of 0.05 meter, and a gas exit flow velocity of 0.001 meter per second. The combined refueling and spillage emissions from the proposed gas station were modeled as a volume source with a horizontal dimension of 13 meter by 13 meters and a vertical dimension of 5 meters.

Figure 3
Air Dispersion Model Emission Sources and Receptor Locations

5.0 HEALTH RISK STANDARDS

Any project with the potential to expose sensitive receptors or the general public to substantial levels of TACs would be deemed to have a potentially significant impact. A health risk is the probability that exposure to a TAC under a given set of conditions will result in an adverse health effect. The health risk is affected by several factors, such as the amount, toxicity, and concentration of the contaminant; meteorological conditions; distance from the emission sources to people; the distance between emission sources; the age, health, and lifestyle of the people living or working at a location; and the length of exposure to the toxic air contaminant.

The term "risk" usually refers to the chance of contracting cancer as a result of an exposure, and it is expressed as a probability: chances-in-a-million. The values expressed for cancer risk do not predict actual cases that will result from exposure to toxic air contaminants. Rather, they state a probability of contracting cancer over and above the background level and over a given exposure to toxic air contaminants.

According to the SCAQMD CEQA Handbook, any project that has the potential to expose the public to toxic air contaminants in excess of the following thresholds would be considered to have a significant air quality impact:

- If the Maximum Incremental Cancer Risk is 10 in one million or greater; or
- Toxic air contaminants from the proposed project would result in a Hazard Index increase of 1 or greater.

6.0 PROJECT IMPACTS

This section assesses the potential health risk from TAC emissions impacts resulting from the operation of the proposed project. Health risks from TACs are twofold. First, TACs are carcinogens according to the State of California. Second, short-term acute and long-term chronic exposure to TACs can cause health effects to the respiratory system. Each of these health risks is discussed below.

6.1 Cancer Risks

According to the OEHHA Guidance, the cancer risk should be calculated using the following formula:

$[\text{Dose-inh (mg/(Kg-day))}] * [\text{Oral Slope Factor (kg-day)/mg}] * [1 \times 10^6] * \text{Age Sensitivity Factor} * \text{Fraction of Time at Home} = \text{Potential Cancer Risk}$

Where:

Oral Slope Factor = 1.1

Age Sensitivity Factor = 10 for 3rd trimester to 2 years; 3 for 2 to 16 years; and 1 for 16 to 29.75 years

Fraction of Time at Home = 0.85 for 3rd trimester to 2 years; 0.72 for 2 to 16 years; and 0.73 for 16 to 70 years

$\text{Dose-inh} = (\text{C}_{\text{air}} * \text{DBR} * \text{A} * \text{EF} * \text{ED} * 10^6) / \text{AT}$

Where:

C_{air} [Concentration in air ($\mu\text{g}/\text{m}^3$)] = (Calculated by AERMOD Model)

DBR [Daily breathing rate (L/kg body weight – day)] = 867 for 3rd trimester to 2 years; 572 for 2 to 16 years and 233 to 16 to 69.75 years.

A [Inhalation absorption factor] = 1

EF [Exposure frequency (days/year)] = 350 for residential uses

ED [Exposure duration (years)] = 30 for residential uses

10^6 [Micrograms to milligrams conversion]

AT [Average time period over which exposure is averaged in days] = 25,550

The OEHHA guidance recommends that Age Sensitivity Factors be utilized, which includes a 10-fold multiplier to infants (3rd trimester to age 2), a 3-fold increase in exposure for children (ages 2 to 16 years old), and an exposure factor of 1 for ages 16 and older. The OEHHA guidance also recommends separate breathing rates for each age group and the SCAQMD recommends utilizing the 90th percentile breathing rates for the 3rd trimester to 2 years and the 80th percentile breathing rates for all older persons. The 90th percentile breathing rates for 3rd trimester is 333 and for 0 to 2 years is 934. In order to simplify the analysis, the 3rd trimester and 0 to 2 year breathing rates were time-weighted averaged together, which resulted in a breathing rate of 867. The 80th percentile breathing rate for 2 to 16 years is 572 and for 16 to 30 years is 261. The OEHHA guidance also recommends utilizing the Fraction of Time at Home in the calculation, since exposure to TAC emissions from the proposed project is not occurring when not at home. The OEHHA developed these calculations from analyzing over 175,000 trips in a survey and determined that only 0.68 percent of these trips overlap with the EF (days per year when residents are on vacation).

According to the above formula, the potential cancer risk for residential receptors equates to $\text{C}_{\text{air}} * 3,336$ for 3rd trimester to age 2, $\text{C}_{\text{air}} * 559$ for ages 2 to 16, and $\text{C}_{\text{air}} * 86.1$ for ages 16 to 29.75. Table I provides a summary of the calculated diesel emission concentrations at the nearby representative sensitive receptors.

Table I – DPM Concentrations and Cancer Risks at Nearby Receptors

| Sensitive Receptor | Receptor Description ¹ | Receptor Location ¹ | | Annual PM10 Concentration ($\mu\text{g}/\text{m}^3$) | | | Cancer Risk Per Million People ² |

SFH = Single-Family Home

¹ Receptor location based on World Geodetic System 1984 (WGS84), Universal Transverse Mercator (UTM).

² Cancer risk based on a residential receptor cancer risk of: $C_{\text{air}}(2019-2021) * 3,336 * 2.25 \text{ years} + C_{\text{air}}(2022-2036) * 559 * 14 \text{ years} + C_{\text{air}}(2037-2048) * 86.1 * 13.75 \text{ years}$.

Source: Calculated from ISC-AERMOD View Version 9.3.0.

Table I shows the highest concentration of DPM created from the proposed project is 0.0199 μg per cubic meter and would occur at Sensitive Receptor 2 for year 2017 to 2019, which represents the single-family home located adjacent to the west side of the project site. Sensitive Receptor 2 was found to result in a cancer risk increase of 6.5 per million people. All DPM equivalent emissions concentrations at the nearby sensitive receptors were found to be below the 10.0 in a million cancer risk threshold that has been discussed above in Section 5.0. Therefore, a less than significant cancer risk would occur from TAC emissions created from the operation of the proposed project.

6.2 Non-Cancer Risks

In addition to the cancer risk from exposure to TAC emissions there is also the potential TAC exposure may result in adverse health impacts from acute and chronic illnesses, which are detailed below.

Chronic Health Impacts

Chronic health effects are characterized by prolonged or repeated exposure to a TAC over many days, months, or years. Symptoms from chronic health impacts may not be immediately apparent and are often irreversible. The chronic hazard index is based on the most impacted sensitive receptor from the proposed project and is calculated from the annual average concentrations of DPM. The relationship for non-cancer chronic health effects is given by the equation:

$$HI_{DPM} = C_{DPM} / REL_{DPM}$$

Where,

- HI_{DPM} = Hazard Index; an expression of the potential for non-cancer health effects.
 C_{DPM} = Annual average diesel particulate matter concentration in $\mu\text{g}/\text{m}^3$.
 REL_{DPM} = Reference Exposure Level (REL) for diesel particulate matter; the DPM concentration at which no adverse health effects are anticipated.

The REL_{DPM} is $5 \mu\text{g}/\text{m}^3$. The OEHHA, as protective for the respiratory system has established this concentration. As detailed above, in Table I, the AERMOD model found that the highest annual concentration at the nearest sensitive receptor is $0.0199 \mu\text{g}/\text{m}^3$ for DPM equivalent chronic non-cancer risk emissions. The resulting Hazard Index is:

$$HI_{DPM} = 0.0199 / 5 = 0.00398$$

The criterion for significance is a Chronic Hazard Index increase of 1.0 or greater, which is detailed above in Section 3.0. Therefore, the on-going operations of the proposed project would result in a less than significant impact due to the non-cancer chronic health risk from TAC emissions created by the proposed project.

Acute Health Impacts

Acute health effects are characterized by sudden and severe exposure and rapid absorption of a TAC. Normally, a single large exposure is involved. Acute health effects are often treatable and reversible. According to the OEHHA, no acute risk has been found to be directly created from DPM, so there is no AREL assigned to DPM, and, therefore, it is not possible to utilize a DPM equivalent emission calculation to calculate the acute health impacts from the proposed project. It should also be noted that the TAC pollutants created from operation of the proposed gas station, convenience market, and quick serve restaurant (QSR) would be limited to naphthalene and PAH without a naphthalene, both of which do not create an acute risk according to the OEHHA. In order to determine the acute health risks from all of the TAC pollutants from diesel emissions listed in Table A above, benzene was utilized as the equivalent emission factor.

In order to account for the acute health impacts created from diesel emissions, the TAC pollutants that are emitted as part of diesel emissions were converted to a benzene equivalent weighting, through multiplying the diesel weight fraction of each TAC to its corresponding acute REL and then dividing by the benzene Acute REL of 27. Then all benzene weighted acute RELs from the TAC pollutants created from diesel emissions and shown in Table A were added together, which resulted in a benzene weighted equivalent factor of 5.07 for DPM emissions. The AERMOD model was re-run for the year 2017 based on all diesel source emission rates multiplied by 5.07 and the gas station benzene emissions as detailed above in Section 4.2. The acute hazard index has been calculated from the maximum hourly concentrations of benzene at the point of maximum impact (PMI) on the project site. The relationship for non-cancer acute health effects is given by the equation:

$$AHI_{benzene} = C_{benzene} / AREL_{benzene}$$

Where,

- $AHI_{benzene}$ = Acute Hazard Index; an expression of the potential for non-cancer health effects.
 $C_{benzene}$ = Maximum hourly concentration of benzene in $\mu\text{g}/\text{m}^3$.
 $AREL_{benzene}$ = Acute Reference Exposure Level.

The AERMOD model found that the highest 24-hour concentration at the PMI is 0.204 $\mu\text{g}/\text{m}^3$ for benzene equivalent acute non-cancer risk emissions and Appendix D provides the benzene equivalent emission concentration calculation printouts from the AERMOD model. The resulting Hazard Index is:

$$\text{AHI} = 0.204 / 27 = 0.00756$$

The criterion for significance is an Acute Hazard Index increase of 1.0 or greater, which is detailed above in Section 5.0. Therefore, the on-going operations of the proposed project would result in a less than significant impact due to the non-cancer acute health risk from TAC emissions created by the proposed project.
