1.0 INTRODUCTION

1.1 GEOGRAPHIC SETTING

The proposed Top Golf project will be developed on land consisting of two vacant parcels totaling approximately 15.8-acres in the City of Ontario. The project is located on the southeast corner of N. Archibald Avenue and 4th Street and north of Deer Creek Channel. The Deer Creek Channel is flowing along the south boundary of the project.

1.2 PURPOSE OF THIS REPORT

The purpose of this report is to determine the storm water runoff generated from a 100-year storm event due to the proposed development and to determine if there is any significant impact on existing storm drain system that received the runoff from the development. The 100-year storm runoff will also be used to size all the proposed on-site drainage pipes and structures.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
 Web Soil Survey URL:
 Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Bernardino County Southwestern Part, California
 Survey Area Data: Version 9, Sep 11, 2017

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jan 5, 2015—Jan 18, 2015

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
HaC	Hanford coarse sandy loam, 2 to 9 percent slopes	A	4.6	27.6%
TuB	Tujunga loamy sand, 0 to 5 percent slopes	A	12.0	72.4%
Totals for Area of Interest			16.5	100.0%

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS). Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values. Please refer to NOAA Atlas 14 document for more information.

2.0 PRE-DEVELOPMENT TOPOGRAPHIC & HYDROLOGIC CONDITIONS

2.1 PRE-DEVELOPMENT TOPOGRAPHY

Under existing conditions, the project site is a trapezoid parcel, currently vacant with relatively level topography descending gradually from north to south. Along all the four edges of the property the topography is relatively steeper than in the center. There is an earthen berm located at the easterly third of the land that covers almost its entire width. The site has poor growth of vegetation throughout. Bushes and trees grow around its boundary. There are some palm trees located on the easterly third of the land and at the top of the aforementioned berm.

2.2 PRE-DEVELOPMENT DRAINAGE SYSTEM

Under existing conditions, the project site mostly sheet flows from north to south towards Deer Creek Channel. There are no drainage facilities on site. However, Deer Creek Channel located on the south side of the project, receives most of the runoff generated on site. There is a 96-inch underground storm drain system located along N. Archibald Avenue. This system collects runoff from N. Archibald Avenue and its tributary area through curb inlet catch basin located at various locations along the street and ultimately drains into Deer Creek Channel across the southwest corner of the proposed project. The runoff from 4th street and portion of northerly edge of project site drains into an existing curb inlet near the intersection of N. Archibald Avenue and 4th Street which then drains in to the aforementioned 96-inch storm drain system on N. Archibald Avenue which ultimately drain in to Deer Creek Channel. Portion of westerly edge of the project site drain into N. Archibald Avenue, which then carried toward south along the N. Archibald Avenue. The detail of the current drainage condition can be found in Hydrology Map, Pre-Development condition in Appendix 3.

3.0 PROPOSED DEVELOPMENT AND DRAINAGE FACILITIES

3.1 PROPOSED DEVELOPMENT

The proposed Top Golf project site is a 15.8-acre site located in the City of Ontario, CA.

The project consists of construction of a commercial Golf Driving Range with entertainment facilities, buildings and paved parking for the user. Project site will be graded to accommodate the installation of pre-fabricated driving range targets in relation to the building and Hitting Bays final elevations. The proposed grading of the site will match the existing edge condition.

3.2 POST-DEVELOPMENT DRAINAGE FACILITY

Onsite storm water runoff will be collected by catch basins inlets, placed at various strategic locations of driving range and parking lot, and then into the proposed underground storm drain system. The runoff will then be conveyed through the Hydrodynamic separator to a properly sized underground Infiltration Chambers. These measures are adopted to mitigate Water Quality requirements of the proposed development. Additional details of project's water quality requirements and mitigation measures can be found in project's water quality report. Once these chambers reach its capacity, the high flow will bypass the Hydrodynamic Separator and discharge into the proposed onsite storm drain system which then ultimately drain into the existing 96-inch storm drain system on N. Archibald Avenue. South edge of the project and portion of easterly property will drain into Deer Creek Channel. North edge of the site within street setback line will drain into 4th Street and similarly westerly edge within street setback line will drain into Archibald Avenue. The proposed drainage condition can be found in the Hydrology Map Post-Development condition in Appendix 3.

4.0 HYDROLOGY AND HYDRAULIC STUDY

4.1 METHODOLOGY

The hydrology study was performed under the guidelines of the San Bernardino County (SBC) Hydrology Manual.

The Rational Method was used to calculate peak runoff rates.

Following Computer program was used:

- CIVILD: Rational Method, Hydrology Calculation;

Results of the analysis are included in this report on Appendix 1.

5.0 RESULTS AND CONCLUSIONS

5.1 PRE-DEVELOPED CONDITIONS 100 YEAR STORM EVENT

In pre-development condition this site and its effective drainage tributary area has two major discharge locations. Based on a Rational method calculation the 100-year flow for each of these discharge locations is given below.

Drainage Area	Remarks	Length (ft)	Area (acre)	Soil Type	Q100 (cfs)
E1.1	Initial Area (4 th Street)	1000	1.8	A	5.3
E1.2	Flow thru street gutter	395	1.0	A	2.1
Discharging in to the existing Curb Inlet on Archibald Avenue Node 1.3 to 96-inch SD then to Deer Creek Channel			2.8	A	7.4
E2	Initial Area (Site Westerly Edge + Archibald Ave.)	747	4.0	A	10.2
Discharging on Archibald Avenue leaving site boundary at Node 2.2			4.0	A	10.2
E3.1	Initial Area (on-site)	1000	4.3	A	11.2
E3.2	Flow thru irregular channel	694	9.9	A	22.2
Discharging directly in to Deer Creek Channel leaving site boundary at Node 3.3			14.2	A	33.4

Thus, the site and its tributary area are discharging **40.8 cfs** (Node 1.3 and Node 3.3 combined) into Deer Creek Channel (Discharge location 1) and discharging **10.2 cfs** into N. Archibald Avenue at the south west corner of project boundary (Discharge location 2).

5.2 POST-DEVELOPMENT CONDITIONS 100 YEAR STORM EVENT

In post-development condition this site and its effective drainage tributary area has two major discharge locations as in the pre-development condition. Based on a Rational method calculation the summary of 100-year flow for each of these discharge locations is given below. For confluence values refer to the Hydrology Map Post Development condition on Appendix 3.

Drainage Area	Remarks	Length (ft)	Area (acre)	Soil Type	Q100 (cfs)
P1.1	Initial Area	1000	1.9	A	5.6
P1.2	Flow thru street gutter	395	0.8	A	1.5
Discharging in to the existing Curb Inlet on Archibald Avenue Node 1.3 to 96-inch SD then to Deer Creek Channel (Discharge Location-1)			2.7	A	7.1
P2.1	Initial Area	634	1.9	A	7.0
P2.2	Initial Area	234	0.3	A	1.4
P2.3	Initial Area	641	5.3	A	20.7
P2.4	Initial Area	563	1.8	A	6.7
P2.5	Initial Area	613	3.2	A	12.6
Discharging in to 96-inch SD on N. Archibald Avenue Node 2.12 then to Deer Creek Channel (Discharge Location-1)			12.5	A	46.6
P3.1	Initial Area	1000	3.2	A	5.8
P3.2	Flow thru irregular channel	590	1.4	A	2.1
Discharging directly in to Deer Creek Channel leaving site boundary at Node 3.3 (Discharge Location-1)			4.6	A	7.9
P4.1	Initial Area	661	1.0	A	3.9
Discharging in to Archibald Avenue leaving site boundary at Node 4.02 (Discharge Location-2)			1.0	A	3.9

According to this calculation, the post-development site and its tributary area, will be discharging 61.6 cfs (Node 1.03, Node 2.12 and Node 3.3) into Deer Creek Channel and 3.9cfs into N. Archibald Avenue at the south west corner of the project boundary. Therefore, due to the proposed development, without any onsite retention, the flow leaving at discharge location-1, into Deer Creek Channel would be increase by 20.8cfs (61.6cfs – 40.8cfs) and the flow at discharge location-2 into N. Archibald Avenue will be decreased by 6.3cfs (10.2cfs-3.9cfs).

5.3 POST-DEVELOPMENT WQMP, MITIGATION AND FLOW RATE

This development will mitigate Water Quality Objective by retaining full DCV onsite. Please refer to Site Specific WQMP for full information and proposed BMPs. Given below is the summery of proposed BMP and retention provided. Please see Appendix 3 for preliminary LID Map for BMP location.

TARGET CAPTURE VOLUME SUMMARY			
BMP Name	DCV (cu-ft.) Required	DCV (cu-ft.) Captured	Model/ Dimensions
Underground Infiltration Chambers IT-1	17,399 cu-ft.	17,527 cu-ft.	96" Perforated CMP 19' x 117'
Underground Infiltration Chambers IT-2	43,599 cu-ft.	43,622 cu-ft.	96" Perforated CMP 63' x 100'

As shown in the Table above that the total volume of runoff retained onsite to mitigate water quality measure is 61,149cft (17527+43622). This retention is provided for the runoff generated from the portion of the drainage tributary area of 19.8 acre (2.7+12.5+4.6) that is area discharging into Deer Creek channel and is labeled as discharge location-1.

A hydrograph analysis showed that after retention of 60,475cft of runoff the post-development discharge flow at Node 2.12 can be reduced to 12.1cfs. After combining this mitigated flow and the other two flows (7.1cfs at Node 1.3 and 7.9cfs at Node 3.3) that are at discharging at location-1, the flow will be equal to 27.1cfs which is less than the pre-development flow of 40.8cfs. As mentioned in paragraph 5.2, that the flow rate at discharge location-2 has been reduced to 3.9cfs which is also less than pre-development flow of 10.2cfs. Thus, it can be concluded that with on-site retention of 61,149cft this development will discharge at a rate that is less than the pre-development discharge rate.

PRE-CONSTRUCTION VS. POST-CONSTRUCTION FLOW SUMMARY BEFORE AND AFTER RETENTION					
Discharge Location	Pre-construction Flow rate	Post-construction Flow rate (No Retention)	Retention Volume Provided	Post-construction Flow rate (After Retention)	Conclusion
Location-1 (Deer Creek Channel)	40.8 cfs.	61.6 cfs.	61,149 cu-ft	27.1 cfs.	Flow reduced by 13.7 cfs.
Location-2 (N. Archibald Avenue)	10.2 cfs.	3.9 cfs.	N/A	3.9 cfs.	Flow reduced by 6.3 cfs.

Detail of Hydrograph analysis with discharge flow rate can be found in Appendix 4

SOILS REPORT

June 7, 2018

Topgolf
8750 North Central Expressway, Suite 1200
Dallas, California 75231

Attention: Ms. Jessica Sanberg

Subject: Results of Percolation/Infiltration Testing
Proposed Golf and Entertainment Facility
SEC 4th Street and North Archibald Avenue
Ontario, California
GPI Project No. 2872.1I

Dear Ms. Sanberg:

This report presents the results of percolation testing performed by Geotechnical Professionals Inc. (GPI) for the design of stormwater disposal systems for the subject site.

Based on the results of the percolation testing, the subsurface soils are suitable for stormwater infiltration based on the measured permeability. The results of our testing are presented below.

GENERAL

This report provides the results of percolation testing performed by GPI for the subject site. The testing was performed to provide an estimate of infiltration of water for disposal of storm water runoff. The location of the site is shown on the attached Site Location Map, Figure 1.

Based on information provided by you and Steve Ellis of Fuscoe Engineering, the project civil engineer, we understand that the proposed storm water disposal system will include infiltration at depths of approximately 3 and 13 feet below existing site grades. The locations of the infiltration structures are shown on the on the Site Plan, Figure 2. The types of disposal systems are shown as well and include a perforated underground infiltration trench (CMP) and shallow above ground infiltration basin.

SCOPE OF SERVICES

As part of our geotechnical investigation, dated, June 4, 2018, we advanced one CPT and drilled two exploratory borings in the vicinity of the proposed infiltration facilities to assess the subsurface conditions. The explorations were extended to depths of 18 to 31 feet below existing grades. Laboratory testing, including percent fines, was also performed. The results of the laboratory testing are presented below. The Logs of CPT and Borings are attached as Figures 3, 4 and 5. The locations of the explorations are shown on the Site Plan, Figure 2.

The scope of services for this phase of our services included installation of 2 test wells, field percolation testing, and the preparation of this report. In general, the testing was performed in accordance with the San Bernardino Method TGD-11 (see References, TGD). The percolation testing was performed using test wells founded at depths and locations corresponding to those provided by the project Civil Engineer.

Based on our experience in the area, groundwater is expected to occur at least 100 feet below existing grades.

PERCOLATION WELLS

The wells were constructed in accordance with the guidelines provided by the TGD. The wells extended approximately 4 feet and 13 feet below existing grades at the shallow basin and the buried infiltration trench, respectively, as indicated by the project Civil Engineer.

The test wells were installed in boreholes drilled using truck-mounted hollow-stem auger drill equipment. The wells consisted of 2-inch diameter perforated PVC casing installed in an 8-inch diameter borehole. Packing material around the slotted sections of the well casing consisted of #3 sand.

RESULTS OF LABORATORY TESTING

We performed laboratory tests to determine the percent fines (silts and clays) for the samples of the on-site soils. The results are shown in the table below.

Fines Content of Selected Samples

BORING NO.	DEPTH (ft)	SOIL DESCRIPTION	PERCENT PASSING No. 200 SIEVE
B-11	10	Sandy Silt (ML)	70
B-11	15	Silty Sand (SM)	39
B-11	20	Sandy Silt (ML)	57
B-11	22	Silty Sand (SM)	43

Moisture content was determined from a number of the soil samples collected below the proposed infiltration depth. The samples were weighed and then were dried in accordance with ASTM D 2216. After drying, the weight of each sample was measured,

and moisture content/dry density was calculated. Moisture content values are presented on the boring logs in the appendix.

RESULTS OF PERCOLATION TESTING

Prior to performing the percolation tests, water was first introduced into the wells using hoses attached to water tanks. We pre-soaked and tested the subsurface soils in accordance with the TGD. The wells were filled with 1 foot of water and emptied in less than 25 minutes. The results are presented in Table 1.

FINDINGS

The results of the infiltration tests performed in the near surface soils indicated adequate infiltration rates with respect to subsurface water infiltration as indicated by the TGD. GPI recommends using the most conservative value of 1.7 in/hr for the design of the disposal systems.

Subsequent to the prescribed presoaking, 6 percolation tests were performed in P-1 and P-2 over a period of 1 hour, measuring the drop in water levels for test periods of 10 minutes.

A pre-adjusted percolation rate was reduced by the reduction factor (R_f) to account for the discharge of water from both the sides and bottom of the boring in accordance with the TGD. A stabilized infiltration rate was assumed when the readings from three consecutive tests are within 10 percent of each other in accordance with the TGD.

The infiltration rates were calculated using the drop in water level over the test increment, corrected using the Porchet Method as provided in the Reference. The results of the calculated infiltration rate for each test are presented Tables 1.

Based on field testing, our evaluations indicate that the site soils are suitable for infiltration of stormwater. Soils are considered potentially feasible for infiltration if the measured infiltration rate obtained from field testing is greater than 0.3 inches per hour (TGD). These measured infiltration rates were greater than 0.3 inches per hour for both wells.

It should be noted that these infiltration rates are for clean, clear water and do not include any effects of sediment, fines, dissolved solids or any other debris as the materials will significantly reduce the percolation rates of the subsurface soils. Prior to infiltration, any water should be thoroughly cleaned of any sediment or other deleterious materials to help reduce the potential for clogging and reduced percolation rates.

From a geotechnical standpoint, we recommend that any open graded materials, such as gravel, used in construction of infiltration facilities be completely encapsulated in a non-woven filter fabric such as Mirafi 140N or equivalent.

LIMITATIONS

The report, exploration logs, and other materials resulting from GPI's efforts were prepared exclusively for use by Topgolf and their consultants in designing the proposed development. The report is not intended to be suitable for reuse on extensions or modifications of the project or for use on any project other than the currently proposed development as it may not contain sufficient or appropriate information for such uses. If this report or portions of this report are provided to contractors or included in specifications, it should be understood that they are provided for information only. This report cannot be utilized by another entity without the express written permission of GPI. This report is an instrument of our services and remains the property of GPI.

Soil deposits may vary in type, strength, and many other important properties between points of exploration due to non-uniformity of the geologic formations or to man-made cut and fill operations. While we cannot evaluate the consistency of the properties of materials in areas not explored, the conclusions drawn in this report are based on the assumption that the data obtained in the field and laboratory are reasonably representative of field conditions and are conducive to interpolation and extrapolation.

Furthermore, our recommendations were developed with the assumption that a proper level of field observation and construction review will be provided during grading, excavation, and foundation construction by GPI. If field conditions during construction appear to be different than is indicated in this report, we should be notified immediately so that we may assess the impact of such conditions on our recommendations. If construction phase services are performed by others they must accept full responsibility for all geotechnical aspects of the project including this report.

Our investigation and evaluations were performed using generally accepted engineering approaches and principles available at this time and the degree of care and skill ordinarily exercised under similar circumstances by reputable Geotechnical Engineers practicing in this area. No other representation, either expressed or implied, is included or intended in our report.

Respectfully submitted,
Geotechnical Professionals Inc.

James E. Harris, P.E., G.E.
Principal

This summary applies only at the location of this cone penetration test and at the time of the exploration. Subsurface conditions may differ at other locations and may change at this location with the passage of time. The interpreted soil description is derived from the friction ratio and cone resistance and is a simplification of actual conditions encountered.

HYDROGRAPH CALCULATION AND RESULTS

San Bernardino County Rational Hydrology Program

(Hydrology Manual Date - August 1986)

CIVILCADD/CIVILDESIGN Engineering Software, (c) 1989-2005 Version 7.1
Rational Hydrology Study Date: 02/07/19

TOP GOLF
TIME OF CONCENTRATION (TC) calculation for flow discharging in to
Deer Creek Channel at discharge location-1

Program License Serial Number 6049

***** Hydrology Study Control Information *****

Rational hydrology study storm event year is 100.0
10 Year storm 1 hour rainfall = 0.956(In.)
100 Year storm 1 hour rainfall = 1.410(In.)
Computed rainfall intensity:
Storm year = 100.00 1 hour rainfall = 1.410 (In.)
Slope used for rainfall intensity curve b = 0.6000
Soil antecedent moisture condition (AMC) = 3

+++++
Process from Point/Station 1.030 to Point/Station 212.000
**** USER DEFINED FLOW INFORMATION AT A POINT ****

Soil classification AP and SCS values input by user
USER INPUT of soil data for subarea
SCS curve number for soil(AMC 2) = 32.00
Adjusted SCS curve number for AMC 3 = 52.00
Pervious ratio(Ap) = 0.1000 Max loss rate(Fm)= 0.079(In/Hr)
Rainfall intensity = 3.000(In/Hr) for a 100.0 year storm
User specified values are as follows:
TC = 17.05 min. Rain intensity = 3.00(In/Hr)
Total area this stream = 2.70(Ac.)
Total Study Area (Main Stream No. 1) = 2.70(Ac.)
Total runoff = 7.10(CFS)

+++++
Process from Point/Station 1.030 to Point/Station 212.000
**** CONFLUENCE OF MAIN STREAMS ****

The following data inside Main Stream is listed:
In Main Stream number: 1
Stream flow area = 2.700(Ac.)
Runoff from this stream = 7.097(CFS)
Time of concentration = 17.05 min.
Rainfall intensity = 3.000(In/Hr)
Area averaged loss rate (Fm) = 0.0785(In/Hr)
Area averaged Pervious ratio (Ap) = 0.1000
Program is now starting with Main Stream No. 2

+++++
Process from Point/Station 2.110 to Point/Station 2.120
**** USER DEFINED FLOW INFORMATION AT A POINT ****

Soil classification AP and SCS values input by user
USER INPUT of soil data for subarea
SCS curve number for soil(AMC 2) = 32.00
Adjusted SCS curve number for AMC 3 = 52.00
Pervious ratio(Ap) = 0.1000 Max loss rate(Fm)= 0.079(In/Hr)
Rainfall intensity = 4.064(In/Hr) for a 100.0 year storm
User specified values are as follows:
TC = 10.28 min. Rain intensity = 4.06(In/Hr)
Total area this stream = 12.50(Ac.)
Total Study Area (Main Stream No. 2) = 15.20(Ac.)
Total runoff = 46.61(CFS)

Process from Point/Station 2.110 to Point/Station 2.120
 **** CONFLUENCE OF MAIN STREAMS ****

The following data inside Main Stream is listed:
 In Main Stream number: 2
 Stream flow area = 12.500(Ac.)
 Runoff from this stream = 46.614(CFS)
 Time of concentration = 10.28 min.
 Rainfall intensity = 4.064(In/Hr)
 Area averaged loss rate (Fm) = 0.0785(In/Hr)
 Area averaged Pervious ratio (Ap) = 0.1000
 Program is now starting with Main Stream No. 3

Process from Point/Station 3.300 to Point/Station 2.120
 **** USER DEFINED FLOW INFORMATION AT A POINT ****

Soil classification AP and SCS values input by user
 USER INPUT of soil data for subarea
 SCS curve number for soil(AMC 2) = 55.20
 Adjusted SCS curve number for AMC 3 = 75.16
 Pervious ratio(Ap) = 1.0000 Max loss rate(Fm)= 0.450(In/Hr)
 Rainfall intensity = 2.364(In/Hr) for a 100.0 year storm
 User specified values are as follows:
 TC = 25.36 min. Rain intensity = 2.36(In/Hr)
 Total area this stream = 4.60(Ac.)
 Total Study Area (Main Stream No. 3) = 19.80(Ac.)
 Total runoff = 7.89(CFS)

Process from Point/Station 3.300 to Point/Station 2.120
 **** CONFLUENCE OF MAIN STREAMS ****

The following data inside Main Stream is listed:
 In Main Stream number: 3
 Stream flow area = 4.600(Ac.)
 Runoff from this stream = 7.888(CFS)
 Time of concentration = 25.36 min.
 Rainfall intensity = 2.364(In/Hr)
 Area averaged loss rate (Fm) = 0.4504(In/Hr)
 Area averaged Pervious ratio (Ap) = 1.0000
 Summary of stream data:

Stream No.	Flow rate (CFS)	Area (Ac.)	TC (min)	Fm (In/Hr)	Rainfall Intensity (In/Hr)
1	7.10	2.700	17.05	0.079	3.000
2	46.61	12.500	10.28	0.079	4.064
3	7.89	4.600	25.36	0.450	2.364

Qmax(1) =
 1.000 * 1.000 * 7.097 +
 0.733 * 1.000 * 46.614 +
 1.332 * 0.672 * 7.888 + = 48.331

Qmax(2) =
 1.364 * 0.603 * 7.097 +
 1.000 * 1.000 * 46.614 +
 1.888 * 0.405 * 7.888 + = 58.489

Qmax(3) =
 0.782 * 1.000 * 7.097 +
 0.573 * 1.000 * 46.614 +
 1.000 * 1.000 * 7.888 + = 40.172

Total of 3 main streams to confluence:
 Flow rates before confluence point:
 8.097 47.614 8.888
 Maximum flow rates at confluence using above data:
 48.331 58.489 40.172
 Area of streams before confluence:
 2.700 12.500 4.600
 Effective area values after confluence:
 18.293 15.993 19.800

Results of confluence:
 Total flow rate = 58.489(CFS)
 Time of concentration = 10.280 min.

1774001TC
Effective stream area after confluence = 15.993(Ac.)
Study area average Pervious fraction(A_p) = 0.309
Study area average soil loss rate(F_m) = 0.165(In/Hr)
Study area total = 19.80(Ac.)
End of computations, Total Study Area = 19.80 (Ac.)

The following figures may

be used for a unit hydrograph study of the same area.

Note: These figures do not consider reduced effective area effects caused by confluences in the rational equation.

Area averaged pervious area fraction(A_p) = 0.309

Area averaged SCS curve number = 37.4
