HARP2 - HRACalc (dated 22118) 7/17/2024 10:53:21 AM - Output Log

GLCs loaded successfully
Pollutants loaded successfully
Pathway receptors loaded successfully
****
RISK SCENARIO SETTINGS

Receptor Type: Resident
Scenario: NCChronic
Calculation Method: Derived

****
EXPOSURE DURATION PARAMETERS FOR CANCER
Exposure duration are only adjusted for cancer assessments

****
PATHWAYS ENABLED

NOTE: Inhalation is always enabled and used for all assessments. The remaining pathways are only used for cancer and noncancer chronic assessments.

Inhalation: True
Soil: True
Dermal: True
Mother's milk: True
Water: False
Fish: False
Homegrown crops: True
Beef: False
Dairy: False
Pig: False
Chicken: False
Egg: False

****
INHALATION

Daily breathing rate: LongTerm24HR

Worker Adjustment Factors
Worker adjustment factors enabled: NO

Fraction at time at home
NOTE: Exposure duration (i.e., start age, end age, ED, & FAH) are only adjusted for cancer assessments.

****
SOIL & DERMAL PATHWAY SETTINGS

```
Deposition rate (m/s): 0.02
Soil mixing depth (m): 0.01
Dermal climate: Warm

**********
HOMEGROWN CROP PATHWAY SETTINGS

Household type: HouseholdsthatGarden
Fraction leafy: 0.137
Fraction exposed: 0.137
Fraction protected: 0.137
Fraction root: 0.137

**********
TIER 2 SETTINGS
Tier2 not used.

**********

Calculating chronic risk
Chronic risk breakdown by pollutant and receptor saved to:
C:\Users\dlarocca\Desktop\HARP2
Files\LENWOODOP\hra\OperationChronicNCChronicRisk.csv
Chronic risk total by receptor saved to: C:\Users\dlarocca\Desktop\HARP2
Files\LENWOODOP\hra\OperationChronicNCChronicRiskSumByRec.csv
HRA ran successfully
```

*HARP - HRACalc v22118 7/17/2024 10:53:21 AM - Chronic Risk - Input File: C:\Users\dlarocca\Desktop\HARP2 Files\LENWOODOP\hra\OperationChronicHRAInput.hra

1 Introduction

This Biological Resources Technical Report documents the results of surveys conducted to identify potential biological resources for the proposed Electric Vehicle Charging Station and Logistics Facility (project) in San Bernardino County (County), California. Figure 1, Project Location, shows the regional location and vicinity of the project site.

The purpose of this report is to (1) describe the condition of existing biological resources within the project site in terms of vegetation communities, plants, wildlife, wildlife habitats, and wetlands; (2) quantify potential direct and indirect impacts to special-status biological resources that could result from the project; (3) discuss those impacts in terms of biological significance in view of federal, state, and local laws and the San Bernardino County Countywide Plan/Policy Plan; and (4) specify measures to avoid, minimize, and/or mitigate any significant impacts that would occur to biological resources as a result of project implementation.

1.1 Project Description

The project includes the project site and off-site areas. The project site encompasses 99.85 acres and includes Assessor's Parcel Numbers 0497-142-03, 0497-142-04, 0497-142-14, and 0497-142-15 (Figure 1, Project Location. It is noted that the project site includes the easterly half of Lenwood Road along the project frontage (to the centerline). There are two off-site areas. One is located along Lenwood Road, and a second area is located off the eastern boundary of the project site). The project proposes the following uses: (1) an approximately 21-acre electric vehicle (EV) charging station to serve light duty/passenger vehicles and medium and heavy-duty trucks, battery storage, and a 15,000 square foot commercial building; and (2) a state-of-the-art concrete tilt-up logistics facility with three buildings totaling 1,341,432 square feet located on approximately 79 acres.

The project site is located in the unincorporated portion of the County, along Lenwood Road, between California State Route 58 and Interstate 15 in an area that is planned for significant intermodal, warehouse, and distribution uses. Across Lenwood Road is land zoned industrial by the City of Barstow (City), including the planned Barstow International Gateway Project being undertaken by the Burlington Northern Santa Fe Railway. The majority of the surrounding parcels are vacant, with the High Desert Estates subdivision located to the south of the project site.

The proposed project would also include landscaping, parking, required utility facilities and upgrades, and a buffer (e.g., landscaping, wall) at the project's southern boundary. Access to and from the site would be via Lenwood Road. Parking would be provided on site for each proposed use in accordance with County Development Code requirements. Water service would be provided by Golden State Water Company and the City would provide sewer service.

Electrical power would be provided by Southern California Edison, supplemented by on-site solar generation/batteries for the EV charging station (e.g., solar canopies above parking spaces). EV charging spaces would be designed and located on site to provide adequate access to customers and comply with public safety vehicle requirements. The hours of operation are proposed to be 24 hours per day, 7 days per week.

1.1.1 Project Location

The approximate 102.15-acre project (consisting of the 99.85 project site and approximately 2.3 acres of off-site areas) is located 4 miles west of downtown Barstow in the unincorporated County (Figure 1, Project Location). Specifically, the project is located in Section 8 of Township 9 North, Range 2 West, as depicted on the U.S. Geological Survey, Barstow, California 7.5-minute topographic quadrangle map. The project is bound to the north by a few rural residential large-lot parcels, to the south by a residential subdivision, to the west by Lenwood Road, and to the east by vacant land. Regional access to the project site is provided via Interstate 15, approximately 3 miles southeast of the project site. Local access to the project site is provided via Lenwood Road.

1.1.2 Project Components

The proposed project would involve construction of an EV charging station that would include EV charging stations for automobiles and mid- and heavy-duty trucks, a truck wash, battery storage, truck scales, and up to a 15,000-square-foot commercial building with a restaurant and amenities (i.e., showers, rest areas) on approximately 21 acres in the southern portion of the site.

The remainder of the site is proposed to include three logistics facilities. Each building would occupy 447,144 square feet for a total of 1,341,432 square feet on approximately 79 acres.

Proposed landscaping would be local ornamental in nature and would feature drought-tolerant trees, shrubs, and groundcovers. Trees planted at regular intervals and drought tolerant plants and groundcovers are proposed along the project site's frontage of Lenwood Road. Landscaping also would be concentrated at driveways, at the building's entries, in and around automobile parking areas, and in the landscape buffer adjacent to the southern property boundary. Prior to issuance of a building permit, the project applicant would be required to submit final planting and irrigation plans to the San Bernardino County for review and approval. The plans are required to comply with the "Landscaping Standards" from Chapter 83.10 of the San Bernardino County Development Code, which establishes requirements for landscape design, automatic irrigation system design, and water-use efficiency. The project's on-site stormwater drainage system would consist of catch basins, underground storm drainpipes, an underground infiltration basin, and bioswales/basin. The system is designed to collect, treat, and/or temporarily detain on-site stormwater runoff before discharging treated flows off site.

Site Access

Access to the site would be provided via numerous driveway entrances along Lenwood Road on the western boundary.

Off-Site Street Improvements

Under existing conditions, Lenwood Road is currently a two-lane north-south oriented roadway that is classified as a 104-foot wide Major Highway in the County's Circulation Master Plan. The project would improve the east side of Lenwood Road to its ultimate half-width along the project site's frontage including the construction of sidewalk, curb and gutter. This half section would contain two northbound travel lanes and half of a 12-foot center lane. In addition, the project would add 6 feet of paving to the west half of Lenwood Road to accommodate the balance of the center striped median lane and would repave the existing southbound travel lane, to the extent such paving

and re-paving have not already been completed by others. Further, the project will transition Lenwood Road back to the existing width and provide striping north of the project boundary to Agate Road.

Utility Improvements

Given the vacant, undeveloped nature of the project site, both wet and dry utilities, including domestic water, sanitary sewer, storm drainage, and electricity, would be extended onto the project site from nearby infrastructure.

Operations

Tenants for the project have not been identified, and logistics facility tenants are considered speculative. Business operations would be expected to be conducted within the enclosed buildings, with the exception of ingress and egress of trucks and passenger vehicles accessing the site; passenger and truck parking; the loading and unloading of trailers within designated truck courts/loading areas; and the internal and external movement of materials around the project site via forklifts, pallet jacks, yard hostlers, and similar equipment. It is anticipated that the facilities would be operational 24 hours per day, 7 days per week. The logistics component would not include cold storage or water-intensive uses.

INTENTIONALLY LEFT BLANK

2 Regulatory Setting

2.1 Federal

2.1.1 Federal Endangered Species Act

The federal Endangered Species Act (FESA) of 1973 (16 USC 1531 et seq.), as amended, is administered by the U.S. Fish and Wildlife Service (USFWS) for most plant and animal species and by the National Oceanic and Atmospheric Administration National Marine Fisheries Service for certain marine species. This legislation is intended to provide a means to conserve the ecosystems upon which endangered and threatened species depend and provide programs for the conservation of those species, thus preventing the extinction of plants and wildlife. FESA defines an endangered species as "any species that is in danger of extinction throughout all or a significant portion of its range." A threatened species is defined as "any species that is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range." Under FESA, it is unlawful to "take" any listed species; "take" is defined as "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct."

Under FESA, USFWS may authorize incidental take of listed species under Section 7, which is generally available for projects that also require other federal agency permits or other approvals, and under Section 10, which provides for the approval of Habitat Conservation Plans on private property without any other federal agency involvement.

2.1.2 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) prohibits the intentional and unintentional take of any migratory bird or any part, nest, or eggs of any such bird. Under the MBTA, "take" is defined as pursuing, hunting, shooting, capturing, collecting, or killing, or attempting to do so (16 USC 703 et seq.). Currently, the Migratory Birds Office considers nests that support eggs, nestlings, or juveniles to be active. Additionally, Executive Order 13186, Responsibilities of Federal Agencies to Protect Migratory Birds, requires that any project with federal involvement address impacts of federal actions on migratory birds with the purpose of promoting conservation of migratory bird populations (66 FR 3853–3856). Executive Order 13186 requires federal agencies to work with USFWS to develop a memorandum of understanding. USFWS reviews actions that might affect these species.

2.1.3 Clean Water Act

The Clean Water Act (CWA) is the major federal legislation governing water quality, providing guidance for the restoration and maintenance of the chemical, physical, and biological integrity of the nation's waters. Section 401 of the CWA requires an applicant for a federal license or permit that may result in a discharge of pollutants into waters of the United States to obtain state certification, thereby ensuring that the discharge will comply with provisions of the CWA. The State Water Resources Control Board (SWRCB) and Regional Water Quality Control Boards (RWQCB) administer the 401 certification program in California. Section 402 of the CWA establishes a permitting system for the discharge of any pollutant (except dredged or fill material) into waters of the United States. Section 404 establishes a permit program administered by the U.S. Army Corps of Engineers (USACE) that regulates the discharge of dredged or fill material into waters of the United States, including wetlands. USACE implementing regulations are found in 33 Code of Federal Regulations (CFR) Parts 320 to 332. Guidelines for implementation are

referred to as the Section 404(b)(1) Guidelines, which were developed by the U.S. Environmental Protection Agency (EPA) in conjunction with USACE (40 CFR 230). The guidelines allow the discharge of dredged or fill material into the aquatic ecosystem only if there is no practicable alternative that would have less adverse impacts.

Wetlands and Other Waters of the United States

The definition of waters of the United States establishes the geographic scope for authority under Section 404 of the CWA; however, the CWA does not specifically define waters of the United States, leaving the definition open to statutory interpretation and agency rulemaking. The definition of what constitutes "waters of the United States" (provided in 33 CFR Section 328.3[a]) has changed multiple times over the past few decades starting with the *United States v. Riverside Bayview Homes, Inc*. court ruling in 1985. Subsequent court proceedings, rule makings, and congressional acts in 2001 (*Solid Waste Agency of Northern Cook County v. United States Army Corps of Engineers*), 2006 (*Rapanos v. United States*), 2015 (Clean Water Rule), 2018 (suspension of the Clean Water Rule), 2019 (formal repeal of the Clean Water Rule), 2020 (Navigable Waters Protection Rule), and 2021 (*Pasqua Tribe et al v. United States Environmental Protection Agency* resulting in remand and vacatur of the Navigable Waters Protection Rule and a return to "the pre-2015 regulatory regime") have attempted to provide greater clarity to the term and its regulatory implementation. On December 30, 2022, the agencies announced the final Revised Definition of "Waters of the United States" rule (Rule) (88 CFR 3004–3144). The Rule was published in the Federal Register on January 18, 2023, and became effective on March 20, 2023, restoring federal jurisdiction over waters that were protected prior to 2015 under the CWA for traditional navigable waters, the territorial seas, and interstate waters, as well as upstream water resources that significantly affect those waters. The Rule represents a re-expansion of federal jurisdiction over certain water bodies and wetlands previously exempt pursuant to the 2020 Navigable Waters Protection Rule. The Rule also considers various subsequent court decisions including two notable Supreme Court decisions.

There are two key changes that the Rule incorporates. Firstly, the Rule reinstates the "Significant Nexus" test. The Significant Nexus test refers to waters that either alone, or in combination with similarly situated waters in the region, significantly affect the chemical, physical, or biological integrity of traditional navigable waters, interstate waters, or the territorial seas (86 CFR 69372-69450). The Significant Nexus test attempts to establish a scientific connection between smaller water bodies, such as ephemeral or intermittent tributaries, and larger, more traditional navigable waters, such as rivers. Significant Nexus evaluations take into consideration hydrologic and ecologic factors including, but not limited to, volume, duration, and the frequency of surface water flow in the resource, its proximity to a traditional navigable water, and the functions performed by the resource on adjacent wetlands. Second, the Rule adopts the "Relatively Permanent Standard" test. To meet the Relatively Permanent Standard, water bodies must be relatively permanent, standing, or continuously flowing and have a continuous surface connection to traditional navigable waters.

On May 25, 2023, the Supreme Court issued its long-anticipated decision in *Sackett v. EPA*, in which it rejected the U.S. EPA's claim that "waters of the United States," as defined in the CWA, includes wetlands with an ecologically significant nexus to traditional navigable waters. The Supreme Court held that only those wetlands with a continuous surface water connection to traditional navigable waterways would be afforded federal protection under the CWA. Specifically, to assert jurisdiction over an adjacent wetland under the CWA, a party must establish that (1) the adjacent body of water constitutes waters of the United States (i.e., a relatively permanent body of water connected to traditional interstate navigable waters) and (2) the wetland has a continuous surface connection with that water, making it difficult to determine where the water ends and the wetland begins. On August 29, 2023, the EPA and USACE announced the final rule amending the 2023 definition of "waters of the United States," conforming

with the *Sackett v. EPA* decision. Some of the key changes include removing the significant nexus test from consideration when identifying tributaries and other waters as federally protected and revising the adjacency test when identifying federally jurisdictional wetlands. Under the EPA's new "waters of the United States" definition, a "waters of the United States" is a relatively permanent, standing, or continuously flowing body of water that has an apparent surface connection to a "traditionally navigable water" to fall within federal purview. The new rule applies to wetlands and streams throughout the U.S. Although the Sackett opinion did not specifically reference streams, the EPA's new rule extends the "continuous surface connection" standard to streams, thereby removing non-permanent, ephemeral streams that do not meet these standards from federal jurisdiction.

The term "wetlands" (a subset of waters of the United States) is defined in 33 CFR, Section 328.3(c)(16), as "areas that are inundated or saturated by surface water or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas." In the absence of wetlands, the limits of USACE jurisdiction in non-tidal waters, such as intermittent streams, extend to the "ordinary high water mark," which is defined in 33 CFR 328.3(c)(7) as "that line on the shore established by the fluctuations of water and indicated by physical characteristics such as a clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas."

2.2 State

2.2.1 California Endangered Species Act

The California Endangered Species Act (CESA) (California Fish and Game Code Sections 2050–2068) provides protection and prohibits the take of plant, fish, and wildlife species listed by the State of California. Unlike FESA, under CESA, state-listed plants have the same degree of protection as wildlife and take is prohibited for both listed and candidate species. Take authorization may be obtained by a project applicant from the California Department of Fish and Wildlife (CDFW) under CESA Section 2081, which allows take of a listed species for educational, scientific, or management purposes. In this case, private developers consult with CDFW to develop a set of measures and standards for managing the listed species, including full mitigation for impacts, funding of mitigation implementation, and monitoring of mitigation measures.

On October 21, 2019, the California Fish and Game Commission received a petition from the Center for Biological Diversity to list western Joshua tree (*Yucca brevifolia*) (Center for Biological Diversity 2019).[1] On November 1, 2019, the California Fish and Game Commission referred the petition to CDFW for evaluation. CDFW evaluated the scientific information presented in the petition and other relevant information possessed by CDFW at the time of review and prepared a report for submittal to the California Fish and Game Commission. The report states that CDFW recommended that the California Fish and Game Commission accept the petition for further consideration of western Joshua tree under CESA. On September 22, 2020, the California Fish and Game Commission approved the petition to accept the candidacy proposal for western Joshua tree, effective October 9, 2020 (CDFW 2020a).

[1] On October 21, 2019, the California Fish and Game Commission received a petition to list the following as threatened under the California Endangered Species Act: (1) western Joshua tree (*Yucca brevifolia*) throughout its California range or, in the event the Commission determines that listing of *Yucca brevifolia* throughout its California range is not warranted, then (2) the western Joshua tree population within the northern part of western Joshua tree's California range or (3) the western Joshua tree population within the southern part of western Joshua tree's California range.

When a plant or wildlife species is granted candidacy under CESA, the species is given the same protection as a threatened or endangered species while the California Fish and Game Commission evaluates whether formal listing as threatened or endangered is warranted. Take or removal of western Joshua trees would require a 2081 ITP from CDFW.

2.2.2 California Fish and Game Code

Fully Protected Species

Sections 3511, 4700, 5050, and 5515 of the California Fish and Game Code outline protection for fully protected species of mammals, birds, reptiles, amphibians, and fish. Species that are fully protected by these sections may not be taken or possessed at any time. CDFW cannot issue permits or licenses that authorize the "take" of any fully protected species, except under certain circumstances, such as scientific research and live capture and relocation of such species pursuant to a permit for the protection of livestock. Furthermore, it is the responsibility of CDFW to maintain viable populations of all native species. Toward that end, CDFW has designated certain vertebrate species as Species of Special Concern because declining population levels, limited ranges, and/or continuing threats have made them vulnerable to extinction.

California Department of Fish and Wildlife Species of Special Concern

CDFW maintains a list of vertebrate animal species considered of "special concern" because declining population levels, limited ranges, and/or continuing threats have made them vulnerable to extinction. A species of special concern is a species, subspecies, or distinct population of an animal native to California that currently satisfies one or more of the following (not necessarily mutually exclusive) criteria:

- Is extirpated (no longer present) from the state or, in the case of birds, is in its primary seasonal or breeding role
- Is listed as threatened or endangered federally, but not by the state
- Meets the state definition of threatened or endangered, but has not formally been listed
- Is experiencing, or formerly experienced, serious noncyclical population declines or range retractions (not reversed) that, if continued or resumed, could qualify it for threatened or endangered status by the state
- Has naturally small populations exhibiting high susceptibility to risk from any factor(s) that, if realized, could lead to declines that would qualify it for threatened or endangered status by the state.

California Fish and Game Code, Section 4150

California Fish and Game Code Section 4150 states a mammal occurring naturally in California that is not a game mammal, fully protected mammal, or fur-bearing mammal is a non-game mammal. A non-game mammal may not be taken or possessed under this code. All bat species occurring naturally in California are considered non-game mammals and are therefore prohibited from take as stated in California Fish and Game Code Section 4150.

Sections 1600–1616

CDFW jurisdiction includes ephemeral, intermittent, and perennial watercourses (including dry washes) and lakes characterized by the presence of definable bed and banks and existing fish or wildlife resources. CDFW takes

jurisdiction to the top of bank of the stream or the limit of the adjacent riparian vegetation, which may include oak woodlands in canyon bottoms. Historical court cases have further extended CDFW jurisdiction to include watercourses that seemingly disappear but reemerge elsewhere. Under the CDFW definition, a watercourse need not exhibit evidence of an ordinary high-water mark to be claimed as jurisdictional. CDFW does not have jurisdiction over ocean or shoreline resources.

Under California Fish and Game Code Sections 1600–1616, CDFW has the authority to regulate work that will substantially divert or obstruct the natural flow of, or substantially change or use any material from, the bed, channel, or bank of any river, stream, or lake. CDFW also has the authority to regulate work that will deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake. This regulation takes the form of a requirement for a Lake or Streambed Alteration Agreement and is applicable to all projects. Applications to CDFW must include a complete certified California Environmental Quality Act (CEQA) document.

California Native Plant Protection Act

The Native Plant Protection Act of 1977 (Sections 1900 et seq. of the California Fish and Game Code) directed CDFW to carry out the Legislature's intent to "preserve, protect and enhance rare and endangered plants in this State." The Native Plant Protection Act gave the California Fish and Game Commission the power to designate native plants as "endangered" or "rare," and protect endangered and rare plants from take. CESA expanded on the original Native Plant Protection Act and enhanced legal protection for plants, but the Native Plant Protection Act remains part of the California Fish and Game Code. To align with federal regulations, the categories of "threatened" and "endangered" species were added to CESA. All "rare" animals in CESA were converted to "threatened," but this did not change for rare plants. Thus, there are three listing categories for plants in California: rare, threatened, and endangered. Because rare plants are not included in CESA, mitigation measures for impacts to rare plants are specified in a formal agreement between CDFW and project proponents.

Nesting Birds

Section 3503 of the California Fish and Game Code states that it is unlawful to take, possess, or needlessly destroy the nests or eggs of any bird, except as otherwise provided by this code or any regulation made pursuant thereto. Section 3503.5 protects all birds of prey (raptors) and their eggs and nests. Section 3511 states that fully protected birds or parts thereof may not be taken or possessed at any time. Section 3513 states that it is unlawful to take or possess any migratory non-game bird as designated in the MBTA.

2.2.3 California Environmental Quality Act

CEQA requires identification of a project's potentially significant impacts on biological resources, and ways that such impacts can be avoided, minimized, or mitigated. CEQA also provides guidelines and thresholds for use by lead agencies for evaluating the significance of proposed impacts.

The State of California CEQA Guidelines (CEQA Guidelines) Section 15380(b)(1) defines endangered animals or plants as species or subspecies whose "survival and reproduction in the wild are in immediate jeopardy from one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, disease, or other factors." A rare animal or plant is defined in CEQA Guidelines Section 15380(b)(2) as a species that, although not presently threatened with extinction, exists "in such small numbers throughout all or a significant portion of its range that it may

become endangered if its environment worsens; or … [t]he species is likely to become endangered within the foreseeable future throughout all or a significant portion of its range and may be considered 'threatened' as that term is used in the federal Endangered Species Act." Additionally, an animal or plant may be presumed to be endangered, rare, or threatened if it meets the criteria for listing, as defined further in CEQA Guidelines Section 15380(c).

CDFW has developed a list of "Special Species" as "a general term that refers to all of the taxa the California Natural Diversity Database (CNDDB) is interested in tracking, regardless of their legal or protection status." This is a broader list than those species that are protected under FESA, CESA, and other California Fish and Game Code provisions, and includes lists developed by other organizations, including, for example, the Audubon Watch List. Guidance documents prepared by other agencies, including the Bureau of Land Management Sensitive Species and USFWS Birds of Special Concern, are also included on this CDFW Special Species list. Additionally, CDFW has concluded that plant species listed as California Rare Plant Rank (CRPR) 1 and 2 by the California Native Plant Society (CNPS), and potentially some CRPR 3 plants, are covered by CEQA Guidelines Section 15380.

Section IV, Appendix G, Environmental Checklist Form, of the CEQA Guidelines requires an evaluation of impacts to "any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or the U.S. Fish and Wildlife Service."

2.2.4 Porter–Cologne Water Quality Control Act

Pursuant to provisions of the Porter–Cologne Water Quality Control Act, the RWQCBs regulate discharging waste, or proposing to discharge waste, within any region that could affect a water of the state (California Water Code Section 13260[a]). The SWRCB defines a water of the state as "any surface water or groundwater, including saline waters, within the boundaries of the state" (California Water Code, Section 13050[e]). All waters of the United States are waters of the state. Waters of the state include wetlands, and the SWRCB definition of wetlands includes the following:

1. Natural wetlands.
2. Wetlands created by modification of a surface water of the state.
3. Artificial wetlands that meet any of the following criteria:
    a. Approved by an agency as compensatory mitigation for impacts to other waters of the state, except where the approving agency explicitly identifies the mitigation as being of limited duration.
    b. Specifically identified in a water quality control plan as a wetland or other water of the state.
    c. Resulted from historic human activity, is not subject to ongoing operation and maintenance, and has become a relatively permanent part of the natural landscape.
    d. Greater than or equal to 1 acre in size unless the artificial wetland was constructed and is currently used and maintained, primarily for one or more of the following purposes: industrial or municipal wastewater treatment or disposal; settling of sediment; detention, retention, infiltration, or treatment of stormwater runoff and other pollutants or runoff subject to regulation under a municipal, construction, or industrial permitting program; treatment of surface waters; agricultural crop irrigation or stock watering; fire suppression; industrial processing or cooling water; active surface mining – even if the site is managed

> for interim wetlands functions and values; log storage; treatment, storage, or distribution of recycled water; maximizing groundwater recharge (this does not include wetlands that have incidental groundwater recharge benefits); or fields flooded for rice growing.

Wetlands that may not meet all of USACE's wetland delineation criteria are considered wetland waters of the state if, "under normal circumstances, (1) the area has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both; (2) the duration of such saturation is sufficient to cause anaerobic conditions in the upper substrate; and (3) the area's vegetation is dominated by hydrophytes or the area lacks vegetation" (SWRCB 2019). Additionally, aquatic resources that USACE determines to not be waters of the United States because they lack a significant nexus to a traditional navigable water or are above the ordinary high-water mark limit of federal jurisdiction may also be considered waters of the state. If a CWA Section 404 permit is not required for a project, the RWQCB may still require a permit (waste discharge requirements) for impacts to waters of the state under the Porter–Cologne Water Quality Control Act.

2.2.5 California Desert Native Plants Act

The purpose of the California Desert Native Plants Act (CDNPA) is to protect certain species of California desert native plants from unlawful harvesting on both public and privately owned lands. The CDNPA only applies within the boundaries of Imperial, Inyo, Kern, Los Angeles, Mono, Riverside, San Bernardino, and San Diego Counties. Within these counties, the CDNPA prohibits the harvest, transport, sale, or possession of specific native desert plants unless a person has a valid permit or wood receipt and the required tags and seals. The appropriate permits, tags, and seals must be obtained from the sheriff or commissioner of the county where collecting will occur, and the county will charge a fee. More information on the CDNPA, including the species protected under the law, is available by reading the provisions of the law.

2.3 Local

2.3.1 San Bernardino County Countywide Plan/Policy Plan and Development Code

The San Bernardino County Countywide Plan/Policy Plan contains the goals and policies that guide future development within the County (San Bernardino County 2022). The County is divided into three distinct geographic planning regions: Valley, Mountains, and Desert. The project site occurs within the Desert Planning Region of the County. The Desert Region is the largest of the three geographic regions located north of the San Bernardino and San Gabriel Mountains and extends east to the Arizona state line. Kern and Los Angeles counties are located to the west, with Inyo County and the Nevada state line to the north. Within this region there is an assemblage of low mountain ranges and desert floors, with the most conspicuous water features being the Mojave and Colorado Rivers. The Desert Planning Region has two goals and policies: (1) to preserve open lands by working with the Bureau of Land Management and (2) to ensure that off-highway-vehicle use is managed to protect environmentally sensitive resources.

The County Policy Plan contains the long-term goals and policies that will guide County decisions, investments, and improvements toward achieving the Countywide Vision and serves as the County's General Plan for the unincorporated areas. The Countywide Plan/Policy Plan's Natural Resources Element describes the purpose and principles, as well as outlines the goals and policies for resources, including air quality; water quality; open space,

parks, and recreation; scenic resources; biological resources; mineral resources; and agriculture and soils. The project would also need to comply with the San Bernardino County Development Code (Development Code). The Development Code (San Bernardino County 2014) implements the goals and policies of the Countywide Plan/Policy Plan. Chapter 88.01.060, Desert Native Plant Protection, of the Development Code is a subset of the Plant Protection and Management Code (Chapter 88.01 of the Development Code) and focuses on the conservation of specified desert plant species. Chapter 88.01.060 specifically states "Removal of all plants protected or regulated by the Desert Native Plants Act (Food and Agricultural Code Section 80001 et seq.) shall comply with the provisions of the Act before the issuance of development permit or approval of a land use application. All members of the family Cactaceae (Cactus Family) require a permit for harvesting under the Desert Native Plants Act." This ordinance contains provisions for the protection of certain desert native plants as follows:

- The following desert native plants with stems 2 inches or greater in diameter or 6 feet or greater in height:
  - *Psorothamnus spinosus* (smoketree).
  - All species of the genus *Prosopis* (mesquites).
- All species of the family Agavaceae (century plants, nolinas, yuccas).
- Creosote Rings, 10 feet or greater in diameter.
- All Joshua trees.
- Any part of any of the following species, whether living or dead:
  - *Olneya tesota* (desert ironwood).
  - All species of the genus *Prosopis* (mesquites).
  - All species of the genus *Cercidium* (palo verdes).

Section 88.01.080 of the Development Code is a subset of the Plant Protection and Management Code and is focused on promoting the health of riparian corridors in relation to their impact on waterways within the region, their use as habitat by various plant and wildlife species, and their stabilization of stream banks. Chapter 88.02 of the Development Code provides a regulatory framework to promote the health of soil communities within the County, limit soil erosion potential, and preserve air quality. This code primarily regulates ground-disturbing activities within the County.

3 Methods

Data regarding biological resources present within the approximately 102.15-acre biological survey area (BSA), which consists of the project site and off-site areas, were obtained through review of pertinent literature, field reconnaissance, habitat assessments, and protocol/focused surveys, which are described in detail in this report. For the purposes of this report, special-status resources are defined as follows:

- Special-status plant species include the following:
  - Species designated as either rare, threatened, or endangered by CDFW or USFWS and protected under either CESA (California Fish and Game Code Section 2050 et seq.) or FESA (16 USC 1531 et seq.)
  - Species that are candidate species being considered or proposed for listing under FESA or CESA
  - Species that are included on the CDFW Special Vascular Plants, Bryophytes, and Lichens List (CDFW 2023a) or species with a CRPR of 1 or 2 in the CNPS Inventory of Rare and Endangered Plants of California (CNPS 2026a)
  - Species protected under the CDNPA
- Special-status wildlife species include the following:
  - Species designated as either rare, threatened, or endangered by CDFW or USFWS and protected under either CESA (California Fish and Game Code Section 2050 et seq.) or FESA (16 USC 1531 et seq.)
  - Species that are candidate species being considered or proposed for listing under FESA or CESA
  - Species that are included on the CDFW Special Animals List (CDFW 2023b)
  - Species designated by California Fish and Game Code Section 4000 as fur-bearing mammals
- Special-status vegetation communities are those designated as sensitive by CDFW (i.e., state rankings of 1, 2, or 3)

3.1 Literature Review

Prior to conducting a field assessment, a literature search and database review were conducted by Dudek biologists to evaluate the natural resources found or potentially occurring within the BSA. The database review included the most recent versions of the CNDDB, special-status species lists (CDFW 2025, 2026b, 2026c), and the CNPS Inventory of Rare and Endangered Plants of California (CNPS 2026a). These databases were reviewed to identify sensitive biological resources present or potentially present for the U.S. Geological Survey 7.5-minute quadrangle on which the BSA is located (Barstow) and the eight surrounding quadrangles (Hinkley, Nebo, Mud Hills, Lane Mountain, Water Valley, Hodge, Barstow SE, and Daggett). The USFWS occurrence data and critical habitat databases were queried using geographic information system (GIS) software based on a 5-mile buffer around the BSA. The BSA was investigated for the potential for historical drainages and aquatic features based on a review of U.S. Geological Survey topographic maps (1:24,000-scale), aerial photographs, the USFWS National Wetland Inventory database (USFWS 2023a), and the Natural Resource Conservation Service's Web Soil Survey (USDA 2023a).

3.2 Field Surveys

Dudek Biologists Callie Amoaku and Zarina Pringle conducted an initial reconnaissance-level field survey of the project site to document biological resources, which included vegetation community and land cover mapping, on January 23, 2023. Additional field surveys within the project site included protocol presence/absence surveys for Mojave Desert tortoise (*Gopherus agassizii*) (Appendix A), a rare plant and desert native plant survey, and Mohave ground squirrel (*Xerospermophilus mohavensis*) protocol level surveys (Appendix B). In January 2026, additional off-site areas were added to the project, and a reconnaissance-level field survey and protocol presence/absence survey for Mojave desert tortoise was conducted within the off-site areas.

Table 1 lists the dates, focus, scope, conditions, and personnel for each survey. Photos of the BSA can be found in Appendix C.

Table 1. Survey Conditions

Date	Biologists	Type of Survey	Times	Weather Conditions
01/23/2023	C. Amoaku Z. Pringle	Biological Reconnaissance Survey	10:09 a.m.–1:00 p.m.	48°F–60°F; 0%-10% cloud cover; 0–19 mph wind
01/24/2023	M. Grubb R. Thomas	Desert Tortoise Protocol Survey	7:00 a.m.–4:00 p.m.	33°F–60°F; 0% cloud cover; 0–2 mph wind
01/25/2023	M. Grubb R. Thomas	Desert Tortoise Protocol Survey	7:00 a.m.–4:00 p.m.	34°F–56°F; cloud cover and wind not recorded
05/22/2023	E. Bergman R. Swick	Rare Plants and Desert Native Plant Survey	10:37 a.m.–3:58 p.m.	83°F–96° F; 10%–40% cloud cover; 0–4 mph wind
3/16/2023–3/20/2023	Dipodomys Ecological Consulting	Mojave Ground Squirrel Survey	Varied	Varied
5/21/2023–5/25/2023	Dipodomys Ecological Consulting	Mojave Ground Squirrel Survey	Varied	Varied
1/22/2026	S. Greely	Biological Reconnaissance Survey and Desert Tortoise Protocol Survey for off-site areas	12:00 p.m.–1:48 p.m.	58°F–59°F; 90%–100% cloud cover; 0–2 mph wind

Notes: mph = miles per hour.

3.2.1 Vegetation Community and Land Cover Mapping

Dudek biologists conducted vegetation mapping within the project site on January 23, 2023. Vegetation mapping for the off-site areas was conducted on January 22, 2026. The survey date, biologists, and weather conditions are included in Table 1. Dudek biologists used CDFW's Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities (CDFW 2018) and California Natural Communities List (CDFW 2025), also referred to as the Natural Communities List, based on A Manual of California Vegetation, Online Edition (CNPS 2026b), to map the entire BSA. These classification systems focus on a quantified, hierarchical approach that includes both floristic (plant species) and physiognomic (community structure and form) factors as currently

observed (as opposed to predicting climax or successional stages). Vegetation communities and land covers were delineated to the vegetation alliance level and, where appropriate, the association level. Some modifications, such as the Preliminary Descriptions of the Terrestrial Natural Communities of California (Holland 1986; Oberbauer et al. 2008), were incorporated to accommodate the lack of conformity of the observed communities to those included in these references.

Vegetation mapping was conducted on foot to visually cover 100% of the BSA. Vegetation communities and land cover types were mapped in the field using an Esri ArcGIS mobile application. Vegetation communities were classified based on site factors, descriptions, distribution, and characteristic species present within an area. Information was recorded, including dominant species and associated cover classes, aspect, canopy height, and visible disturbance factors.

Minimum mapping units were established to standardize the scale and appropriate evaluation of stands of vegetation, as recommended by CDFW (2020b). Mapping standards call for a minimum mapping unit of not greater than 10 acres, but usually 1 or 2 acres, for upland natural communities not considered sensitive and 0.25 acres for sensitive vegetation communities and wetland or riparian vegetation communities. Visible disturbance factors were also noted during vegetation mapping.

Following completion of the fieldwork, Dudek GIS analysts digitized the vegetation boundaries as delineated by the field biologists and created a GIS coverage for vegetation communities and land covers.

3.2.2 Flora

Latin and common names for plant species with a CRPR follow the CNPS Inventory of Rare, Threatened, and Endangered Plants of California (CNPS 2026a). For plant species without a CRPR, Latin names follow the Jepson Interchange List of Currently Accepted Names of Native and Naturalized Plants of California (Jepson Flora Project 2023) and common names follow the California Natural Communities list (CDFW 2025) or the U.S. Department of Agriculture's Natural Resources Conservation Service PLANTS Database (USDA 2023b). Plant species observed within the BSA are provided in Appendix D, Plant Compendium.

3.2.3 Fauna

All wildlife species detected during field surveys by sight, vocalizations, burrows, tracks, scat, or other signs were recorded. The site was visually scanned with and without binoculars to identify wildlife. Latin and common names of animals follow Crother (2017) for reptiles and amphibians, American Ornithological Society (AOS 2018) for birds, and the Mammal Diversity Database (ASM 2021) for mammals. Wildlife species observed within the BSA are provided in Appendix E, Wildlife Compendium.

3.2.4 Special-Status and Regulated Resources

3.2.4.1 Rare Plant and Desert Native Plant Survey

Project Site

Based on the results of the literature review discussed in Section 3.1, at least ten (10) species with a CRPR of 1B (i.e., plants rare, threatened, or endangered in California and elsewhere) have records that occur in the U.S.

Geological Survey quadrangle within which the project site occurs, or have records that occur in the surrounding eight (8) quadrangles, indicating the potential for suitable habitat to be present within the project site for some of these species. As such, Dudek botanists conducted a rare plant survey on May 22, 2023, within the project site.

Dudek conducted a desert native plant survey within the project site concurrently with the rare plant survey. Field survey methods and mapping of rare plants and desert native plants conformed to the CNPS Botanical Survey Guidelines (CNPS 2001), Protocols for Surveying and Evaluating Impacts to Special-Status Native Plant Populations and Sensitive Natural Communities (CDFW 2018), and General Rare Plant Survey Guidelines (Cypher 2002). The desert native plant survey was conducted in accordance with the CDNPA. The survey dates, biologists, and weather conditions are included in Table 1. All desert native plant target species are conspicuous shrubs that would have been identifiable during the survey and are as follows:

1. All species of the family Agavaceae (century plants, nolinas, yuccas).
2. All species of the family Cactaceae (cacti), except for the plants listed in subdivisions (b) and (c) of Section 80072 which may be harvested under a permit obtained pursuant to that section.
3. All species of the family Fouquieriaceae (ocotillo, candlewood).
4. All species of the genus *Prosopis* (mesquites).
5. All species of the genus *Cercidium* (palos verdes).
6. *Acacia greggii* (catclaw).
7. *Atriplex hymenelytra* (desert-holly).
8. *Dalea spinosa* (smoke tree).
9. *Olneya tesota* (desert ironwood), including both dead and live desert ironwood.

Off-Site Areas

Dudek conducted vegetation mapping and a habitat assessment in the off-site areas on January 22, 2026. A single biologists walked one transect north and one transect south within all off-site areas. The habitat assessment included an assessment of whether the off-site areas would warrant focused surveys for rare plants and desert native plants.

3.2.4.2 Desert Tortoise Protocol-Level Survey

On April 2, 1990, the Mojave population of the desert tortoise was listed by USFWS as threatened (55 FR 12178–12191). Proposed actions within the range of the desert tortoise fall under purview of FESA. Because the project site lies within the range for desert tortoise (CDFW 2026d) and in the Western Recovery Unit (USFWS 2011), Dudek conducted focused surveys for Mojave desert tortoise to determine the status of the species within the project site. To evaluate the impacts to Mojave desert tortoise, protocol surveys were conducted in accordance with the Pre-Project Field Survey Protocol for Potential Desert Tortoise Habitats section included in Preparing for Any Action That May Occur within the Range of the Mojave Desert Tortoise (*Gopherus agassizii*) (USFWS 2018) (see Mojave Desert Tortoise Data Sheets in Appendix A). Following the small project survey protocol, Dudek biologists conducted the survey in January 2023 for the project site. A second Mojave desert tortoise small project survey was conducted in the off-site areas in January 2026. Both survey efforts were conducted by walking approximately 10-meter-wide transects for 100% coverage of the entire BSA (Figure 2, Survey Areas).

3.2.4.3 Mohave Ground Squirrel Habitat Assessment and Protocol Survey

Dipodomys Ecological Consulting biologists conducted an initial visual survey within the project site on March 14, 2023, for Mohave ground squirrel. The visual survey was conducted by driving and walking throughout the project site to identify suitable habitat for Mohave ground squirrel, which is consistent with the methods described within the 2010 CDFW Mohave Ground Squirrel Survey Guidelines (CDFW 2010). Field methods are described in detail in Appendix B. Following an initial visual survey, two 5-day live trapping surveys for Mohave ground squirrel were conducted from March 16 to March 20, 2023 and from May 21 to May 25, 2023, within the project site.[2] The methods used for this trapping effort followed the most recent CDFW Mohave Ground Squirrel Survey Guidelines issued in 2010 (CDFW 2010). Camera trappings consisted of five camera stations in locations designated by CDFW; methods are described in detail in Appendix B.

3.2.5 Survey Limitations

Limitations of the surveys include a diurnal bias and the absence of trapping for reptiles, amphibians, and small mammals at night. The surveys were conducted during the daytime to maximize the detection of most wildlife. Most birds are active in the daytime, so diurnal surveys maximize the number of bird observations. Conversely, diurnal surveys usually result in few observations of mammals, many of which may only be active at night. In addition, many species of reptiles and amphibians are secretive in their habits and are difficult to observe using standard meandering transects.

[2] Dipodomys Ecological Consulting conducted live trapping and camera stations across two 50-trap 10 × 10 survey grids, referred to as the northern and southern project parcels.

INTENTIONALLY LEFT BLANK

4 Environmental Setting

The purpose of this section is to describe the general existing conditions within, and adjacent to, the BSA (i.e., project site and off-site areas) to document the baseline conditions for this report and subsequent analysis.

4.1 Climate

The BSA is west of the City of Barstow within unincorporated San Bernardino County. The average annual temperature in Barstow ranges from 47.3°F to 88.1°F (ACIS 2026). The average annual precipitation for Barstow is 4.19 inches (ACIS 2026). Periods of extended drought are common throughout the region.

4.2 Geology and Topography

The BSA is located at the southern edge of the Mojave Desert on alluvial plains derived from the Mojave River. The topography gradually increases from north to south, toward the hills situated between Interstate 15 and Highway 247.

The BSA is composed of undeveloped vacant lands bisected by dirt roads. The topography within the BSA consists of a gradually sloping plain. Elevation ranges from approximately 2,197 feet above mean sea level (amsl) in the northern portion of the BSA to 2,272 feet amsl in the southern portion of the BSA. Adjacent land uses include large-lot rural residential areas and Agate Road to the north, residential areas and Birch Road to the east, residential areas and Jasper Road to the south, and Lenwood Road and undeveloped areas to the west.

4.3 Soils

According to the U.S. Department of Agriculture Natural Resource Conservation Service's Web Soil Survey (USDA 2023a), the BSA consists of seven soil map units: Cajon sand (2% to 9% slopes); Joshua loam (2% to 5% slopes); Rosamond loam, saline-alkali; Victorville sandy loam; Villa loamy sand; dune lands; and rock outcrop-lithic torriorthents complex (15% to 50% slopes). These soil map units are presented in Figure 3, Soils, and the component soil series, where applicable, are described below. .

Cajon Series consists of very deep, somewhat excessively drained soils that formed in sandy alluvium from dominantly granitic rocks. The Cajon soils are on recent fans and river terraces at elevations of 200 to 4,300 feet amsl. Creosote bush (*Larrea tridentata*), saltbush (*Atriplex* sp.), western Joshua trees, and annual grasses and forbs are common vegetation found on these soils (USDA 2023a).

Joshua Series consists of moderately deep, well drained soils that formed in material derived from mixed sources. The Joshua soils are on old gravelly erosion pavement covered terraces more typically found at elevations of 2,600 to 3,000 feet amsl. Sparse stands of creosote bush, white bursage (*Ambrosia dumosa*), yucca species, saltbush, and annual grasses and forbs are common vegetation found on these soils (USDA 2023a).

Rosamond Series consists of deep, well drained soils that form in weathered material, primarily from granitic alluvium. These soils are found in the lower margin of alluvial fans, typically at elevations from 2,200 to 2,900.

Native vegetation typically found within these soils includes rabbit brush (*Ericameria nauseosa*), big sagebrush (*Artemisia tridentata*), as well as *Atriplex spp*. along with annual and perennial grass and weeds (USDA 2023a).

Victorville Series consists of deep, moderately well drained soils that formed in mixed alluvium dominantly from granitic sources. The Victorville soils are on low river terraces and flood pains at elevations of 2,200 to 2,800 feet amsl. Rabbitbrush (*Polypogon monspeliensis*), salt grass (*Distichlis spicata*), annual weeds, grass, and cottonwood trees (*Populus* spp.) are common vegetation found on these soils (USDA 2023a).

Villa Series consists of deep, moderately well drained soils that formed in alluvium derived from granitic rock. Villa soils are on river flood plains at elevations of 2,100 to 2,800 feet amsl. Saltbush, mesquite, creosote bush, and annual grasses and forbs are common vegetation found on these soils (USDA 2023a).

4.4 Surrounding Land Uses

The BSA consists of primarily vacant, undeveloped land. The BSA has had multiple dirt roads running through it since the mid-1990s (Google Earth 2023), some of which appeared to continue to experience frequent use at the time of the 2023 site visits. The BSA is bordered to the north by undeveloped land and scattered residential areas, to the east by vacant land and residential areas, to the south by residential areas, and to the west by Lenwood Road and open space. Specific land uses in the immediate vicinity include the following:

- North: Agate Road and rural residential areas
- East: Vacant land and rural residential areas
- South: Residential areas
- West: Lenwood Road and vacant land

In the broader BSA vicinity, development includes both residential and agricultural uses, as well as U.S. Highways 66 and 58 and Interstate 15.

4.5 Watersheds and Hydrology

The BSA occurs within the southwestern portion of the Mojave subbasin, Hydrologic Unit Code 18090208 (Figure 4, Hydrologic Setting). The Mojave subbasin comprises approximately 4,500 square miles and is entirely within San Bernardino County. The primary geographic and surface hydrologic feature of the watershed is the Mojave River, which flows north for approximately 120 miles until it reaches Silver Dry Lake near the community of Baker. Some reaches of the Mojave River flow underground in the confined riverbed channel. The Mojave River is approximately 0.5 miles northwest of the BSA; however, there are no jurisdictional water features within the BSA.

The BSA occurs within the northern portion of the Lenwood-Mojave River Subwatershed (Hydrologic Unit Code 180902081102) of the Daggett Wash-Mojave River watershed (Hydrologic Unit Code 1809020811). The Daggett Wash-Mojave watershed comprises approximately 189 square miles (120,960 acres) and is in the City of Barstow in the high desert part of southwestern San Bernardino County, approximately 70 miles northeast of San Bernardino. The Mojave River flows northeast underground within the Daggett Wash-Mojave River watershed. Additionally, small ephemeral streams in the hills surrounding Barstow contribute a small amount of water to the watershed after storm events.

5 Results

This section describes the results of the literature review, field surveys, and habitat assessments within the BSA.

5.1 Vegetation Communities and Land Covers

Two vegetation communities and two land cover types were mapped within the BSA (Table 2). The spatial distribution of the vegetation communities and land covers are presented in Figure 5, Biological Resources.

State rankings of 1, 2, or 3 are considered high priority for inventory or special status and impacts to these communities typically require mitigation. There are no vegetation communities considered sensitive biological resources by CDFW under CEQA (CDFW 2025) within the BSA.

Table 2. Vegetation Communities and Land Cover Types within the BSA

Floristic Alliance	Association[1]	State Ranking[2]	Project Site (acres)	Off-Site (acres)	Total BSA (acres)
Allscale Scrub	*Atriplex polycarpa* sparse playa	G4/S4	49.38	0.001	49.38
Creosote Bush–Allscale Scrub	*Larrea tridentata–Atriplex polycarpa*	G5/S5	49.65	0.064	49.71
Disturbed Habitat	N/A	GNR/SNR	0.820	1.12	1.94
Urban/Developed	N/A	GNR/SNR	0.007	1.11	1.12
		Total[3]	**99.85**	**2.30**	**102.15**

Notes: N/A = not applicable.

1 The spatial distribution of the vegetation communities and land covers are presented in Figure 5, Biological Resources.

2 The conservation status of a vegetation community is designated by a number from 1 to 5, preceded by a letter reflecting the appropriate geographic scale of the assessment (G = global, N = national, and S = subnational). The numbers have the following meaning (NatureServe 2023):
1 = critically imperiled
2 = imperiled
3 = vulnerable to extirpation or extinction
4 = apparently secure
5 = demonstrably widespread, abundant, and secure
GNR = unranked, global rank not yet assessed
SNR = unranked, subnational rank not yet assessed

3 Total acreages may not sum exactly due to rounding.

5.1.1 Allscale Scrub (36.340.00)

The allscale scrub (*Atriplex polycarpa*) shrubland alliance includes allscale scrub (*Atriplex polycarpa*) as the dominant species in the shrub canopy. Shrubs are less than 3 meters (9 feet 8 inches) tall, with an open to continuous canopy; emergent trees may be present but at low cover (CNPS 2026b). Species associated with this alliance include white bursage, cheesebush (*Ambrosia salsola*), four-wing saltbush (*Atriplex canescens*), alkali goldenbush (*Isocoma acradenia*), and creosote bush (CNPS 2026b).

The allscale scrub alliance is ranked by the CDFW as a G4S4 alliance. This ranking indicates that globally and within California the alliance is apparently secure (CDFW 2026c; NatureServe 2023); therefore, the community is not considered sensitive under CEQA.

The only association within the alliance mapped on site was *Atriplex polycarpa* sparse playa.

Associated species observed within this alliance in the field include allscale scrub, pale desert thorn (*Lycium pallidum*), with some four-wing salt bush and shadscale (*Atriplex confertifolia*) present at lower cover. Allscale scrub covers approximately 50% of the BSA and is comprised of a large patch that extends from the central to the northern portion of the BSA.

5.1.2 Creosote Bush (33.010.00)

Creosote bush–allscale scrub (*Larrea tridentata–Atriplex polycarpa*) shrubland alliance includes creosote bush as the dominant or co-dominant species in the shrub canopy. Creosote bush has an open shrub canopy of less than 3 meters (9 feet 8 inches) tall, with an open to intermittent herbaceous layer of annuals and perennial grasses (CNPS 2026b). Species associated with the creosote bush alliance include white bursage, cheesebush, allscale scrub, shadscale, Nevada joint fir (*Ephedra nevadensis*), and Anderson's boxthorn (*Lycium andersonii*). Emergent trees such as honey mesquite (*Prosopis glandulosa*), and Joshua tree may be present at low cover (CNPS 2026b).

The creosote bush alliance is ranked by the CDFW as a G5S5 alliance. This ranking indicates that globally and within California the alliance is widespread, abundant, and secure (CDFW 2026c; NatureServe 2023); therefore, the community is not considered sensitive under CEQA.

The only association within the alliance mapped on site was *Larrea tridentata–Atriplex polycarpa.*

Associated species observed within this alliance in the field include creosote, longleaf joint-fir (*Ephedra trifurca*), and allscale scrub. The creosote bush alliance covers approximately 50% of the BSA and is comprised of two large patches in the northern and southern portions of the BSA.

5.1.3 Disturbed Habitat

Although not recognized by the Natural Communities List (CDFW 2025), disturbed habitat refers to areas that have had anthropogenic disturbance and, as a result, cannot be identified as a native or naturalized vegetation association. However, these areas do have a recognizable soil substrate. If vegetation is present, it is almost entirely composed of non-native vegetation, such as ornamentals or ruderal exotic species. Disturbed habitat is not considered a sensitive biological resource by CDFW under CEQA (CDFW 2025).

Disturbed habitat within the BSA consists of maintained areas immediately adjacent to Lenwood Road that appear to have been recently graded or appear to be somewhat regularly maintained.

5.1.4 Urban/Developed

While not recognized by the Natural Communities List (CDFW 2025), urban/developed land represents areas that have been constructed upon or otherwise physically altered to an extent that native vegetation communities are not supported. This land cover type generally consists of semi-permanent structures, homes, parking lots, pavement

or hardscape, and landscaped areas that require maintenance and irrigation (e.g., ornamental greenbelts). Typically, this land cover type is unvegetated or supports a variety of ornamental plants and landscaping. Urban/developed land is not considered a sensitive biological resource by CDFW under CEQA (CDFW 2025).

5.2 Plants and Wildlife Observed

5.2.1 Plants

A total of 36 species of native or naturalized plants, 27 native (75%) and 9 non-native (25%), were recorded within the BSA. A list of plant species observed is provided in Appendix D. Additionally, results of the desert native plant survey were negative for the target species listed in Section 3.2.4.1 of this report.

5.2.2 Wildlife

A total of 40 wildlife species were recorded within the BSA or vicinity during surveys (Appendix E).

Birds detected on or in the immediate vicinity of the BSA were loggerhead shrike (*Lanius ludovicianus*), Say's phoebe (*Sayornis saya*), common raven (*Corvus corax*), mourning dove (*Zenaida macroura*), northern mockingbird (*Mimus polyglottos*), and white-crowned sparrow (*Zonotrichia leucophrys*). Mammals detected consisted of desert kit fox (*Vulpes macrotis arsipus*), black-tailed jackrabbit (*Lepus californicus*), and desert cottontail (*Sylvilagus audubonii*). The only reptile detected was common side-blotched lizard (*Uta stansburiana*). Invertebrates detected consisted of butterflies including painted lady (*Vanessa cardui*), orange sulphur (*Colias eurytheme*), and checkered white (*Pontia protodice*) (Appendix E).

5.3 Special-Status and Regulated Resources

Appendix F, Special-Status Plants Potentially Occurring within the Biological Survey Area, and Appendix G, Special-Status Wildlife Potentially Occurring within the Biological Survey Area, provide tables of all special-status species whose geographic ranges fall within the general BSA vicinity. Special-status species' potential to occur within the BSA were evaluated based on known species distribution, species-specific habitat preferences, and Dudek biologists' knowledge of regional biological resources. Species potentially occurring within the BSA are identified as having moderate or high potential to occur based on habitat conditions on site; species for which there is little or no suitable habitat are identified as not expected to occur or having low potential to occur.

5.3.1 Special-Status Plants

Special-status plants include those listed, or candidates for listing, as threatened or endangered by USFWS and CDFW and species identified as rare by CNPS (particularly CRPR 1A, presumed extinct in California; CRPR 1B, rare, threatened, or endangered throughout its range; and CRPR 2, rare or endangered in California, more common elsewhere).

Dudek biologists performed an extensive desktop review of literature, existing documentation, and GIS data to evaluate the potential for special-status plant species to occur within the BSA. Based on the results of the literature review and database searches, 12 special-status plant species were reported in the CNDDB and CNPS databases as

occurring in the nine U.S. Geological Survey 7.5-minute quadrangles containing and surrounding the BSA. Each special-status plant species was assigned a rating of "not expected" or "low," "moderate," or "high" potential to occur based on relative location to known occurrences, vegetation community, soil, and elevation. All 12 special-status plant species were determined to have a low potential to occur or are not expected to occur within the BSA based on the soils, vegetation communities (habitat) present, elevation range, and previous known location. While none of the special-status plant species were determined to have a moderate or high potential to occur, out of an abundance of caution, Dudek botanists conducted a special-status plant survey (i.e., rare plant survey) concurrently with the desert native plant survey, which is discussed in Section 5.3.2 of this report, within the project site. This survey was conducted during the blooming period for the 12 special-status species identified by the database search. No listed or non-listed CRPR 1 or CRPR 2 plants were observed during the 2023 survey efforts; however, one (1) CRPR 4.2 species, Mojave spineflower (*Chorizanthe spinosa*) was observed during the survey effort.

The off-site area located along Lenwood Road is comprised entirely of either urban developed lands or disturbed habitat and does not provide suitable habitat for any of the 12 special-status plant species identified in the literature review and database searches; therefore, a focused survey for special-status plants was not warranted for this area. The off-site area located along the eastern boundary of the project site is continuation of the creosote bush scrub mapped immediately adjacent to this area within the project site. Given the similarity in habitat, proximity to already surveyed areas where survey results for special-status plants were negative, and the small size of this off-site area (i.e., less than 0.1 acre), it was determined that a special-status plant survey was not warranted for this off-site area.

In addition, there is no USFWS-designated critical habitat for listed plant species overlapping or immediately adjacent to the BSA and the BSA occurs outside the CDFW distribution for western Joshua tree (USFWS 2023b; CDFW 2020a). Appendix F includes all special-status plants known to occur within the vicinity of the project and their potential to occur.

5.3.2 Desert Native Plants

As previously discussed, Dudek botanists conducted a desert native plant survey to comply with the CDNPA and in support of the project. This survey was conducted concurrently with a special-status plant (i.e., rare plant) survey.

The survey resulted in the detection of silver cholla (*Cylindropuntia echinocarpa*) within the project site. No other desert native plants were detected during the survey efforts.

5.3.2 Special-Status Wildlife

Special-status wildlife include those listed, or candidates for listing, as threatened or endangered by USFWS and CDFW and those designated as Species of Special Concern by CDFW and as sensitive by USFWS.

Similar to special-status plants, Dudek biologists performed an extensive desktop review of literature, existing documentation, and GIS data to evaluate the potential for special-status wildlife species to occur within the BSA. Each special-status wildlife species was assigned a rating of "not expected" or "low," "moderate," or "high" potential to occur based on relative location to known occurrences and vegetation community/habitat association; the results of this analysis are provided in Appendix G. Listed species with any potential to occur and non-listed special-status species with a moderate or higher potential to occur are discussed herein. Those special-status wildlife species that are not expected or have low potential to occur in the BSA are also included in Appendix G; however, these species are not discussed further because no significant direct or indirect impacts are expected.

Based on the results of the literature review and database searches, 15 special-status wildlife species were reported in the CNDDB and USFWS databases as occurring in the vicinity of the BSA. Of these species, five were determined to have at least a moderate potential to occur within the BSA based on suitable habitat present and nearby occurrences: LeConte's thrasher (*Toxostoma lecontei*), burrowing owl (*Athene cunicularia*), Mohave fringe-toed lizard (*Uma scoparia*), Mojave desert tortoise, and Mohave ground squirrel.

Mojave desert tortoise was confirmed absent from the BSA through focused protocol-level surveys. Focused surveys conducted for Mohave ground squirrel resulted in the capture of round-tailed ground squirrels (*Xerospermophilus tereticaudus*), including some that had characteristics of Mohave ground squirrels (i.e., a flatter tail, and brown dorsal pelage), indicating the potential for the presence of hybridized individuals, which is discussed in further detail, below.

Two special-status species, loggerhead shrike (*Lanius ludovicianus*) and desert kit fox (*Vulpes macrotis arsipus*), were incidentally observed during 2023 survey efforts within the project site. These species are summarized in Table 3 and discussed further below.

There is no USFWS-designated critical habitat for listed wildlife species overlapping or immediately adjacent to the BSA (USFWS 2023b). The closest designated critical habitat for Mojave desert tortoise is located approximately 2.2 miles from the BSA. The project site does not contain nursery sites, such as bat colony roosting sites or colonial bird nesting areas.

Table 3. Special-Status Wildlife Species Observed or with Moderate or High Potential to Occur within the Biological Survey Area

Scientific Name	Common Name	Status (Federal/ State)	Habitat	Potential to Occur[1]
Birds				
Athene cunicularia (burrow sites and some wintering sites)	burrowing owl	BCC/SC	Nests and forages in grassland, open scrub, and agriculture, particularly with ground squirrel burrows	**High potential to occur**. The BSA contains open scrub habitat, with some small mammal and desert kit fox burrows. No burrowing owls or sign of burrowing owl were observed on site. The nearest mapped CNDDB record is approximately 1 mile southeast of the BSA (CDFW 2023d).
Lanius ludovicianus (nesting)	loggerhead shrike	None/SSC	Nests and forages in open habitats with scattered shrubs, trees, or other perches	**Present**. A loggerhead shrike was observed on site by Dudek biologists on January 23, 2023, during the biological reconnaissance survey.
Toxostoma lecontei	LeConte's thrasher	BCC/SSC	Nests and forages in desert wash, desert scrub, alkali desert scrub, desert succulent, and Joshua tree habitats; nests in spiny shrubs or cactus	**Moderate potential to occur**. The BSA contains desert scrub, with spiny shrub species such as *Lycium* and *Atriplex* that may provide suitable nesting habitat. The nearest mapped CNDDB record is approximately 4 miles east of the BSA in Barstow proper (CDFW 2023d). While this is a historical record, there are a few current sightings of the species less than 5 miles from the BSA (eBird 2023).
Mammals				
Spermophilus (Xerospermophilus) mohavensis	Mohave ground squirrel	None/ST	Desert scrub habitats, including those dominated by creosote bush and burrobush, desert sink scrub, and desert saltbush scrub	**Potentially Present**. Focused trapping surveys were conducted in the northern and southern portions of the site. Round-tailed ground squirrels (*Xerospermophilus tereticaudus*) exhibiting some Mohave ground squirrel physical characteristics were detected. CDFW stated they consider round-tailed ground squirrel–Mohave ground squirrel hybrids to be protected under CESA and require authorization for take (Wood, pers. comm., 2024). The BSA contains desert scrub with creosote bush, as well as saltbush scrub. Additionally, Mohave

Table 3. Special-Status Wildlife Species Observed or with Moderate or High Potential to Occur within the Biological Survey Area

Scientific Name	Common Name	Status (Federal/ State)	Habitat	Potential to Occur[1]
				ground squirrel is known to prefer sandy to gravelly soils, which are present within the BSA (Johnson et al. 2019; USDA 2023a). Some small mammal burrows were observed within the BSA, though many appeared to be inactive. The nearest mapped CNDDB record is approximately 1.25 miles north of the BSA. Additionally, there are several other records of the species within 5 miles of the BSA (CDFW 2023d).
Vulpes macrotis arsipus	desert kit fox	None/None[2]	Sparse vegetated scrub habitats such as creosote scrub communities that support abundant rodent populations (Center for Biological Diversity 2013)	**Present**. An active desert kit fox burrow complex and tracks were incidentally observed on site by a Dudek biologist during January 2023 desert tortoise surveys, and one individual desert kit fox was detected at a Mohave ground squirrel camera trap.
Reptiles				
Gopherus agassizii	Mojave desert tortoise	FT/ST	Arid and semi-arid habitats in Mojave and Sonoran Deserts, including sandy or gravelly locations along riverbanks, washes, sandy dunes, canyon bottoms, desert oases, rocky hillsides, creosote flats, and hillsides	**Absent**. While the study area contains creosote flats, some sandy dunes, and sandy hillsides that could provide suitable habitat to this species, no desert tortoise individuals, burrows, or their sign were observed during focused surveys in January 2023 and in January 2026. The southwestern end of the study area overlaps with a CNDDB delineated area containing what was historically the largest of four primary populations in California (CDFW 2023).
Uma scoparia	Mohave fringe-toed lizard	None/SSC	Loose wind-blown sand dunes, flats with sandy hummocks, washes, and banks of rivers	**High potential to occur**. The BSA contains areas of loose wind-blown dunes and flats with sandy hummocks. Additionally, the BSA contains shrubs and annual plants that may support arthropods, a part of the Mohave fringe-toed lizard diet. The

Table 3. Special-Status Wildlife Species Observed or with Moderate or High Potential to Occur within the Biological Survey Area

Scientific Name	Common Name	Status (Federal/ State)	Habitat	Potential to Occur[1]
				nearest mapped CNDDB record is approximately 1 mile southwest of the BSA (CDFW 2023d).

Notes:
BSA = biological survey area; CNDDB = California Natural Diversity Database.

1 **Determination Definitions**:

- **Present**: The species (individual or diagnostic sign) was observed within the site boundary during survey efforts in support of the project.
- **Potentially present**: Possible round-tailed ground squirrel–Mohave ground squirrel hybrids were trapped within the project site.
- **High potential to occur:** The species has not been documented on the site but has been observed within dispersal range of the site (or is within range and is highly mobile or cryptic – e.g., migratory avian species or legless lizard) and high-quality habitat is present.
- **Moderate potential to occur:** The species has not been documented on or within dispersal range of the site, but the site is within its known geographic range and moderate- to high-quality habitat is present. General rarity may be considered.

2 Section 4000 of the California Fish and Game Code defines "kit fox" as a fur-bearing mammal.

Status Designations

Federal
BCC: U.S. Fish and Wildlife Service Bird of Conservation Concern
FT: Federally listed as theatened

State
SC: State candidate for listing as threatened or endangered
SSC: California Species of Special Concern
ST: State listed as threatened

Mojave Desert Tortoise

Mojave desert tortoise is a federally and state-listed threatened species. The range of the Mojave desert tortoise includes portions of the Mojave Desert and the Colorado Desert in Southern California (parts of Inyo, Kern, Los Angeles, San Bernardino, and Riverside Counties), southern Nevada (Clark, Esmeralda, Nye, and Lincoln Counties), northwestern Arizona (Mohave County), and southwestern Utah (Washington County).

Typical habitat for Mojave desert tortoise in the Mojave Desert is creosote bush scrub where annual precipitation ranges from 2 to 8 inches, with a relatively high diversity of perennial plants and high productivity of ephemeral plants. Throughout most of the Mojave Desert, Mojave desert tortoises occur most commonly on gently sloping terrain with sandy gravel soils and where there is sparse cover of low-growing shrubs, which allows for the establishment of herbaceous plants. Soils must be friable enough for digging burrows, but firm enough that burrows do not collapse (USFWS 2010). Although populations of Mojave desert tortoise are not generally known to inhabit elevations much above 4,000 feet amsl, they occur from below sea level to an elevation of 7,300 feet amsl. Occupied habitat varies from flats and slopes dominated by creosote bush scrub at low elevations, to rocky slopes in blackbrush and juniper woodland ecotones at higher elevations (USFWS 2010).

To evaluate the impacts to Mojave desert tortoise, protocol surveys were conducted in accordance with the Pre-project Field Survey Protocol for Potential Desert Tortoise Habitats section included in Preparing for Any Action That May Occur within the Range of the Mojave Desert Tortoise (*Gopherus agassizii*) (USFWS 2018). Biologists surveyed the BSA by walking approximately 10-meter-wide (32.8 feet) transects for 100% coverage. A buffer survey was not conducted because there was no legal access to these areas.

The BSA contains suitable sandy soils and Mojave desert scrub habitat; however, there are several regional barriers to potential population sources around the BSA, such as high traffic roads; residential areas; and railroad tracks. The BSA overlaps a CNDDB delineated area containing what was historically the largest of four primary populations in California; however, the nearest CNDDB occurrence is from 2007 and is mapped approximately 6.1 miles west of the BSA (CDFW 2026a).

No Mojave desert tortoise individuals, burrows, or diagnostic sign (i.e., tracks, scat, water catch basins, courtship rings, or carcasses) were observed during the 2023 and 2026 focused protocol surveys; therefore, this species is considered absent from the BSA and will not be analyzed further. Survey forms are included as Appendix B.

Burrowing Owl

Burrowing owl is a USFWS Bird of Conservation Concern and a CDFW candidate for listing as threatened or endangered. With a relatively wide-ranging distribution throughout the west, are considered to be habitat generalists (Lantz et al. 2004). In California, burrowing owls are yearlong residents of open, dry grassland and desert habitats and grass, forb, and open shrub stages of pinyon-juniper and ponderosa pine habitats (Zeiner et al. 1990). Preferred habitat is generally typified by short, sparse vegetation with few shrubs, level to gentle topography, and well-drained soils (Haug et al. 1993).

The presence of burrows is the most essential component of burrowing owl habitat because they are required for nesting, roosting, cover, and caching prey (Coulombe 1971; Green and Anthony 1989; Haug et al. 1993; Martin 1973). In California, western burrowing owls most commonly live in burrows created by California ground squirrels (*Otospermophilus beecheyi*). Burrowing owls may occur in human-altered landscapes such as agricultural areas,

ruderal grassy fields, vacant lots, and pastures if the vegetation structure is suitable (i.e., open and sparse), useable burrows are available, and foraging habitat occurs in proximity (Gervais et al. 2008). Debris piles, riprap, culverts, and pipes can be used for nesting and roosting.

No burrowing owls or sign of burrowing owl were observed on site. However, this species has a high potential to occur within the BSA. Suitable habitat and small mammal burrows are present in the project site, and the nearest mapped CNDDB record is approximately 1 mile southeast of the BSA (CDFW 2026d).

Loggerhead Shrike

Loggerhead shrike is a USFWS Bird of Conservation Concern and a CDFW Species of Special Concern. It is widespread throughout the United States, Mexico, and portions of Canada (Humple 2008). The species is a yearlong resident in most of the United States, including from California east to Virginia and south to Florida, and in Mexico. In California, although shrikes are widespread at the lower elevations in the state, the largest breeding populations are in portions of the Central Valley, the Coast Ranges, and the southeastern deserts (Humple 2008).

Preferred habitats for loggerhead shrike are open areas that include scattered shrubs, trees, posts, fences, utility lines, or other structures that provide hunting perches with views of open ground, as well as nearby spiny vegetation or human-made structures (such as the top of chain-link fences or barbed wire) that provide a location to impale prey upon for storage or manipulation (Humple 2008). Loggerhead shrikes occur most frequently in riparian areas along woodland edges, grasslands with sufficient perch and butcher sites, scrublands, and open canopied woodlands, although they can be quite common in agricultural and grazing areas and can sometimes be found in mowed roadsides, cemeteries, and golf courses. Loggerhead shrikes occur rarely in heavily urbanized areas. For nesting, the height of shrubs and presence of canopy cover are most important (Yosef 1996).

A loggerhead shrike was incidentally observed within the western portion of the project site by Dudek biologists on January 23, 2023, during the biological reconnaissance survey.

LeConte's Thrasher

LeConte's thrasher is a USFWS Bird of Conservation Concern and a CDFW Species of Special Concern. LeConte's thrasher is found from below sea level up to 1,600 meters amsl in Southern California deserts in southern Mono County to the Mexican border (Dobkin and Granholm 2005; Sheppard 1996).

Preferred habitat for LeConte's thrasher is open desert wash, desert scrub, alkali desert scrub, and desert succulent shrub habitats; LeConte's thrasher also occurs in western Joshua tree habitat with scattered shrubs (Dobkin and Granholm 2005). This species prefers gently rolling to well-drained slopes occupied by saltbush and joint fir (Ephedra sp.) with bare ground or sparse grass (Fitton 2008). These conditions are generally found on bajadas or alluvial fans where the slopes are bisected by dry washes (Fitton 2008). Much of the LeConte's thrasher's diet consists of insects found within leaf litter under desert shrubs; therefore, habitat must contain sufficient ground cover (Sheppard 1996).

The BSA supports suitable foraging habitat (desert scrub) and nesting habitat (spiny shrubs and cactus). The nearest mapped CNDDB record is approximately 4 miles east of the BSA in Barstow proper (CDFW 2026d). While this is a historical record, there are a few current sightings of the species less than 5 miles from the BSA (eBird 2023). Based on the discussion above, LeConte's thrasher has a moderate potential to occur within the BSA.

Mohave Ground Squirrel

Mohave ground squirrel is a State of California threatened species. This species' distribution range is restricted to the Mojave Desert in San Bernardino, Los Angeles, Kern, and Inyo Counties (Zeiner et al. 1990). Mohave ground squirrels generally inhabit areas where the soil is friable and sandy or gravelly. Mohave ground squirrels occur in desert scrub habitats dominated by creosote bush and desert saltbush scrub at elevations of 1,800 to 5,000 feet amsl (CDFW 2023b).

The BSA contains desert scrub with creosote bush, as well as saltbush scrub. Additionally, Mohave ground squirrel is known to prefer sandy to gravelly soils, which are present within the BSA (Johnson et al. 2019; USDA 2023a). The BSA occurs along the edge of the south-central part of the historical range of Mohave ground squirrel but is located outside any core areas, key populations centers, or corridors (Figure 6, Wildlife Movement) (CDFW 2019a; Leitner 2015). The Mohave ground squirrel U.S. Geological Survey habitat suitability model depicted in Figure 3 of the conservation strategy (CDFW 2019a) ranks the majority of the project site as being moderately suitable Mohave ground squirrel habitat. The BSA is outside of the Mohave ground squirrel modeled habitat by the Desert Renewable Energy Conservation Plan (DRECP) (BLM 2016).

Historic protocol surveys were conducted within the BSA's vicinity between 2008 and 2012 by Leitner (2015); however, these surveys yielded no Mohave ground squirrel captures south of the Mojave River (refer to Figure 8 in Leitner 2015). The closest CNDDB occurrence from 1990 is approximately 1.25 miles north of the BSA and occurs within an area currently functioning as an agricultural operation (CDFW 2026d). This occurrence record does not specify the number of individuals or whether they were trapped or merely a visual observation. Focused trapping surveys were conducted in the northern and southern portions of the BSA. Camera trapping surveys were deployed in the center portions of the site; no Mohave ground squirrels were recorded (Appendix B).

Genetic testing of specimen samples by Leitner and Bell and Matocq (CDFW 2019a) confirmed that (1) pure Mohave ground squirrel and pure round-tailed ground squirrel are living near one another, (2) hybridization does occur, (3) some hybrids are fertile, and (4) backcrossing occurs in both species. The study concluded that although "hybridization has occurred within contact zones, recent examination of mitochondrial, morphological, allozyme, and chromosome data show no evidence of broad introgression of alleles between the two species (CDFW 2019a [Bell et al., 2009; Bell and Matocq, 2011]), indicating hybridization is a rare occurrence and further supporting the retention of full species designation for MGS" (CDFW 2019a).

During the focused protocol surveys conducted by Dipodomys in 2023, round-tailed ground squirrels exhibiting some Mohave ground squirrel physical characteristics (specifically a flatter tail and brown dorsal pelage) were captured within the project site (Appendix B). These captured individuals indicate the potential for the presence of hybridized round-tailed ground squirrel–Mohave ground squirrel individuals within the project site. Ear tissue samples from each potential hybrid individual captured were collected for potential future DNA testing; however, genetic testing was not conducted on these samples to confirm if these individuals are hybrids (as such testing was not available at the time of trapping). Based on the historical records of Mohave ground squirrel occurrences and the presence of potential round-tailed ground squirrel–Mohave ground squirrel hybrids, it is possible that a population of Mohave ground squirrel was present within or near the project site in the near past.

Desert Kit Fox

While desert kit fox is not listed by USFWS or CDFW under any special-status designation, the species is considered a "fur-bearing mammal," and is protected from take under the California Fish and Game Commission's Mammal Hunting Regulations (Subdivision 2, Chapter 5), which effectively protects it from hunting pressure. No hunting or trapping is proposed or would be allowed with project implementation, and the project would not be allowed take of this species. Desert kit foxes live in the open desert, on creosote bush flats, and among sand dunes (NPS 2015).

An active desert kit fox burrow complex and tracks were incidentally observed within the project site by a Dudek biologists during the January 2023 desert tortoise survey effort. In addition, at least one desert kit fox individual was incidentally observed during camera trapping efforts for Mohave ground squirrel in 2023 (Figure 5, Biological Resources).

Mohave Fringe-Toed Lizard

The Mohave fringe-toed lizard is a CDFW Species of Special Concern. This species' range is in the Mojave Desert from Death Valley to western Arizona (California Herps 2023). Mohave fringe-toed lizards inhabit sparsely vegetated sand dunes, flats with hummocks, washes, and banks of rivers from 300 feet to 3,000 feet amsl. Adults eat small arthropods.

The BSA contains areas of loose sand dune soils with shrubs and annual plants that may support arthropods, a part of the Mohave fringe-toed lizard diet. The nearest mapped CNDDB record is approximately 1 mile southwest of the BSA (CDFW 2026d). Therefore, Mohave fringe-toed lizard has a high potential to occur within the BSA.

5.4 Aquatic Resources

There are no potential waters or wetland waters of the U.S. or state within the BSA. Additionally, the National Hydrography Dataset and National Wetlands Inventory does not identify any potential aquatic resources present within the BSA (Figure 4, Hydrologic Setting).

5.5 Wildlife Corridors and Habitat Linkages

Wildlife corridors are linear features that connect large patches of natural open space and provide avenues for the migration of animals. Wildlife corridors contribute to population viability by ensuring continual exchange of genes between populations, providing access to adjacent habitat areas for foraging and mating, and providing routes for recolonization of habitat after local extirpation or ecological catastrophes (e.g., fires). Habitat linkages are small patches that join larger blocks of habitat and help reduce the adverse effects of habitat fragmentation. Habitat linkages provide a potential route for gene flow and long-term dispersal of plants and animals and may also serve as primary habitat for smaller animals, such as reptiles and amphibians. Habitat linkages may be continuous habitat or discrete habitat islands that function as stepping-stones for dispersal. The BSA occurs within multiple established wildlife corridors and/or habitat linkage areas as described in detail below.

California Essential Habitat Connectivity Project/California Desert Connectivity Project

The California Essential Habitat Connectivity (CEHC) Project was initiated by CDFW and the California Department of Transportation and identifies a network of Natural Landscape Blocks (i.e., relatively intact, large areas of land)

and Essential Connectivity Areas (i.e., an area of land that serves to connect at least two Natural Landscape Blocks). These areas represent modeled linkages and landscape blocks that need to be maintained to support natural communities and to provide guidance in the development of infrastructure and land use. The primary goal of the California Desert Connectivity Project is to identify areas where maintenance or restoration of ecological connectivity is essential for conserving the unique biological diversity of California's deserts. The California Desert Connectivity Project aims to strategically conserve and restore essential connections between remaining wildland areas, as an effective and cost-efficient measure to reduce the adverse effects of habitat loss and fragmentation (Penrod et al. 2012).

The BSA is mapped on the outer fringe of the San Bernardino Mountains–Calico Mountains Essential Connectivity Area within the Mojave Desert ecoregion under the CEHC Project (Spencer et al. 2010), listed as "less permeable" (lower ecological condition and less permeable to ecological flows) (CDFW 2023a) (Figure 6, Wildlife Movement). This larger overall connectivity area is part of a regional connection between the Mojave National Preserve to the east, Transverse Ranges to the south, and Death Valley to the northeast. The connectivity area may support regional wildlife movement for species such as desert kit fox, a variety of small mammals, reptiles, and birds.

The BSA also occurs within a CEHC Desert Tortoise Conservation Area/Least Cost Corridor and South Coast Wildlands Desert Linkage Network, which can provide a habitat mosaic containing viable populations of smaller terrestrial species (e.g., desert tortoise, desert kit fox) and allow for gene flow through diffusion of populations over a period of generations. The BSA is located outside of the Natural Landscape Blocks, Bighorn Sheep Populations, Potential Riparian Connections, and "most likely corridors" (Spencer et al. 2010). Additionally, the BSA is mapped as a CDFW Area of Conservation Emphasis Terrestrial Connectivity, Rank 4 (Spencer et al. 2010) (Figure 7, Terrestrial Connectivity – Areas of Conservation Emphasis (ACE)). There are Area of Conservation Emphasis Rank 5 areas, which are the highest priority areas for movement corridors, located approximately 4 miles south of the BSA and 6 miles northwest. According to CDFW (2019b), Area of Conservation Emphasis Rank 4 is defined as follows:

> These are the habitat connectivity linkages mapped in the CEHC and fine-scale regional connectivity studies. Habitat connectivity linkages are often based on species-specific models and represent the best connections between core natural areas to maintain habitat connectivity. Linkages have more implementation flexibility than irreplaceable and essential corridors. Any linkage areas not included in the category above [i.e., rank 5] was included here.

Summary

The BSA is currently undeveloped land located within the established wildlife corridors and/or habitat linkage areas (i.e., the San Bernardino Mountains–Calico Mountains Essential Connectivity Area, the Desert Tortoise Conservation Area/Least Cost Corridor, and South Coast Wildlands Desert Linkage Network) as described above that allow for viable populations of terrestrial species and/or species' dispersal movements through the vicinity. Surveys for desert tortoise were negative, indicating the site is not used by this species. Surveys within the BSA determined that potential round-tailed ground squirrel–Mohave ground squirrel hybrids may be present within the project site. However, the BSA occurs outside any Mohave ground squirrel core areas, key populations centers, or corridors (CDFW 2019a; Leitner 2015). Additionally, desert kit fox, a variety of small mammals, reptiles, and birds were observed within the project site during the 2023 and 2026 survey efforts.

Because the BSA overlaps with an Essential Connectivity Area and a California Desert Linkage Network and is a Rank 4 Area of Conservation Emphasis under CDFW, there are opportunities for wildlife to move across the site

when migrating through the region. However, the BSA is immediately adjacent to Lenwood Road along its western boundary, a residential area abuts the southern boundary, and rural residential areas are north and south of the site. Therefore, wildlife movement through the BSA's vicinity is, to some extent, restricted. The only relatively unrestricted areas occur along the Mojave River, to the north of the BSA, and undeveloped land to the west of the BSA. If wildlife enters the BSA, movement directly north, east, and south would be restricted by development, railroads, and roadways.

6 Project Impacts

This section addresses direct and indirect impacts to special-status biological resources that would result from implementation of the project. The significance determinations for proposed or potential impacts are described in this section, as well as recommended mitigation. Cumulative impacts are addressed in the project's CEQA document.

6.1 Explanation of Findings of Significance

Impacts to special-status vegetation communities, plant and wildlife species, and jurisdictional waters, including wetlands, must be quantified and analyzed to determine whether such impacts are significant under CEQA. CEQA Guidelines Section 15064(b) states that an ironclad definition of "significant" effect is not possible because the significance of an activity may vary with the setting. Appendix G, Environmental Checklist, of the CEQA Guidelines, however, does provide "examples of consequences which may be deemed to be a significant effect on the environment" (14 CCR 15064[e]). These effects include substantial effects on rare or endangered species of animal or plant or the habitat of the species. CEQA Guidelines Section 15065(a) is also helpful in defining whether a project may have a significant effect on the environment. Under that section, a proposed project may have a significant effect on the environment if the project has the potential to (1) substantially degrade the quality of the environment, (2) substantially reduce the habitat of a fish or wildlife species, (3) cause a fish or wildlife population to drop below self-sustaining levels, (4) threaten to eliminate a plant or animal community, (5) reduce the number or restrict the range of a rare or endangered plant or animal, or (6) eliminate important examples of a major period of California history or prehistory.

The following are the significance questions for biological resources provided in Appendix G of the CEQA Guidelines, which for the purposes of this report are treated as thresholds to determine if the project would potentially have a significant effect if it does any of the following:

- **Impact BIO-1.** Has a substantial adverse effect, either directly or through habitat modifications, on any species identified as being a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS.
- **Impact BIO-2.** Has a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by CDFW or USFWS.
- **Impact BIO-3.** Has a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.
- **Impact BIO-4.** Interferes substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impedes the use of native wildlife nursery sites.
- **Impact BIO-5.** Conflicts with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.
- **Impact BIO-6.** Conflicts with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan.

The evaluation of whether an impact to a particular biological resource is significant must consider both the resource itself and the role of that resource in a regional context. Substantial impacts are those that contribute to, or result in, permanent loss of an important resource, such as a population of a rare plant or wildlife species. Impacts may be important locally because they result in an adverse alteration of existing site conditions but not considered significant because they do not contribute substantially to the permanent loss of that resource regionally. The severity of an impact is the primary determinant of whether that impact can be mitigated to a level below significance.

6.2 Definition of Impacts

Direct impacts refer to complete loss of a biological resource. For purposes of this report, it refers to the area where vegetation clearing, grubbing, or grading replaces biological resources. Direct impacts were quantified by overlaying the proposed impact limits on the biological resources map of the BSA. Direct temporary impacts would occur from grading and development of the proposed project. Direct permanent impacts would occur from construction of an industrial/logistics building and associated off-site improvements including construction of EV charging stations and a logistics facility.

Indirect impacts are reasonably foreseeable effects caused by a project's implementation on remaining or adjacent biological resources outside the direct disturbance zone. For purposes of this report, indirect impacts may affect areas outside the disturbance. Indirect impacts may be short-term and construction related or long-term and associated with development in proximity to biological resources.

Cumulative impacts refer to the combined environmental effects of a project and other relevant projects. These impacts may be minor when analyzed individually but become collectively significant as they occur over time. Cumulative impacts are addressed in the project's CEQA document.

The evaluation of project impacts is organized below using Appendix G of the CEQA Guidelines.

6.3 Impacts Analysis

The acreage of impacts is provided in Table 4. Figure 8, Project Impacts, shows the biological resources on site that will be impacted by the project.

Table 4. Impacts to Vegetation Communities, Floristic Alliances and Associations, and Land Cover Types within the Biological Survey Area

Floristic Alliance	Association	Vegetation Community[1]	Ranking[2]	Total Existing BSA (Acres)	On-Site Permanent Impacts (Acres)	Off-Site Permanent Impacts (Acres)	Total Impacts (Acres)[3]
Scrub							
Atriplex polycarpa	*Atriplex polycarpa*	Allscale Scrub	G4/S5	49.38	49.38	0.001	49.38
Larrea tridentata	*Larrea tridentata–Atriplex polycarpa*	Creosote Bush–Allscale Scrub	G5/S5	49.71	49.65	0.064	49.71
Disturbed and Developed							
N/A	N/A	Disturbed Habitat	GNR/SNR	1.94	0.82	1.12	1.94
N/A	N/A	Urban/Developed	GNR/SNR	1.12	0.007	1.11	1.12
			Total[3]	**102.15**	**99.85**	**2.30**	**102.15**

Notes:
BSA = biological survey area; N/A = not applicable.
1 The spatial distribution of permanent impacts to vegetation communities and land covers are presented in Figure 8, Project Impacts.
2 The conservation status of a vegetation community is designated by a number from 1 to 5, preceded by a letter reflecting the appropriate geographic scale of the assessment (G = global, N = national, and S = subnational). The numbers have the following meaning (NatureServe 2023):
1 = critically imperiled
2 = imperiled
3 = vulnerable to extirpation or extinction
4 = apparently secure
5 = demonstrably widespread, abundant, and secure
GNR = unranked, global rank not yet assessed
SNR = unranked, subnational rank not yet assessed
3 Total acreages may not sum exactly due to rounding.

6.3.1 Impact BIO-1: Special-Status Species

The following significance determinations were made based on the impacts of the project. Recommended mitigation measures referenced in this section are provided in Chapter 7, Mitigation.

6.3.1.1 Impacts to Special-Status Plants

One non-listed special-status plant species, Mojave spineflower, was observed within the BSA. Mojave spineflower was not included as a target species for the 2023 focused surveys because it is a CRPR 4.2 species. Species with a CRPR of 4 are not considered rare but only limited in distribution or infrequent throughout a boarder range in California (e.g. "Watch List" species) (CNPS 2026a). Thus, given that CEQA requires findings of significance for projects that "threaten to … reduce the number or restrict the range of a rare or endangered plant," Mojave spineflower will not be analyzed further.

No other special-status plant species were observed or determined to have a high or moderate potential to occur within the BSA; therefore, the project would have no direct or indirect impacts to special-status plant species. In addition, the BSA does not occur within or adjacent to federally designated critical habitat for any special-status plant species, and there would be no direct or indirect impacts to critical habitat.

Direct Impacts

Based on the discussion above, no direct impacts to special-status plant species are anticipated, and no avoidance or compensatory mitigation measures are required.

Indirect Impacts

Construction-Related: Potential short-term or temporary indirect impacts to special-status plant species resulting from construction activities include inadvertent spillover impacts, including unintentional clearing, trampling, or grading outside of the project footprint; generation of fugitive dust; changes in hydrology resulting from construction, including sedimentation and erosion; and the release of chemical pollutants. These potential construction-related activities could result in indirect impacts to special-status plant species that would be considered potentially significant absent mitigation.

Implementation of **Mitigation Measure (MM) BIO-1** (Construction-Related Indirect Impacts to Special-Status Plants, Special-Status Wildlife, Sensitive Vegetation Communities, and Aquatic Resources) would reduce potential indirect impacts to a less-than-significant level through biological monitoring, requirement of a Worker Environmental Awareness Training that will cover the special-status resources and mitigation requirements for the project, delineation of project boundaries, implementation of standard dust control measures, development of a stormwater pollution prevention plan (SWPPP), and requiring all vehicles and equipment be serviced in designated staging areas. With implementation of **MM-BIO-1**, the effect of construction-related indirect impacts to special-status plant species would be minimized to **less than significant with mitigation incorporated**.

Long-Term: Potential long-term indirect impacts that could result from development near special-status plant species or their suitable habitat include chemical releases such as oils and grease from vehicles that could degrade habitat; increased human presence that could lead to unauthorized access to potential habitat for special-status plants; increased invasive plant species that may degrade habitat; and trampling of vegetation and soil compaction

by humans, which could affect soil moisture, water penetration, surface flows, and erosion. These potential long-term indirect impacts to special-status plant species would be potentially significant absent mitigation.

Implementation of **MM-BIO-2** (Long-Term Indirect Impacts to Special-Status Plants, Special-Status Wildlife, Sensitive Vegetation Communities, and Aquatic Resources) would reduce potential long-term indirect impacts to a less-than-significant level by requiring measures to ensure project runoff is not altered from existing conditions and toxicants are not discharged, restoration of temporary impacts, preparation of landscaping plans that will emphasize native species and not include species from the California Invasive Plant Council (Cal-IPC) California Invasive Plant Inventory (Cal-IPC 2006), and incorporation of barriers to prevent unauthorized public access to areas with potential habitat for special-status plants. With implementation of **MM-BIO-2**, the effect of long-term indirect impacts to special-status plant species would be minimized to **less-than-significant with mitigation incorporated**.

6.3.1.2 Impacts to Special-Status Wildlife

A total of three special-status wildlife species were determined to have a moderate or high potential to occur within the BSA based on known species distribution, species-specific habitat preferences, and habitat conditions within the BSA: burrowing owl, LeConte's thrasher, and Mohave fringe-toed lizard. Additionally, two special-status wildlife species were observed directly or via active, diagnostic sign within the BSA. Specifically, an active desert kit fox burrow was observed and a loggerhead shrike was observed within the BSA. Finally, I potential round-tailed ground squirrel–Mohave ground squirrel hybrids were captured within the BSA during protocol Mohave ground squirrel surveys; therefore, Mohave ground squirrel is considered to be potentially present within the BSA and has a high potential to occur.[3]

Focused surveys conducted for Mojave desert tortoise were negative; therefore, this species is not expected to occur and will not be analyzed further. The BSA does not occur within or adjacent to federally designated critical habitat for special-status wildlife species, and there would be no direct or indirect impacts to critical habitat.

Direct Impacts

Direct impacts can potentially occur to special-status wildlife species from impacts to foraging and/or habitat and impacts to the species from injury or mortality of individuals from construction and operational activities. The project could result in significant, direct impacts to four special-status wildlife species that have a moderate to high potential to occur within the BSA (burrowing owl, LeConte's thrasher, Mohave ground squirrel, and Mohave fringe-toed lizard) and two special-status wildlife species that were observed within the BSA (loggerhead shrike and desert kit fox).[4]

Burrowing Owl

Focused surveys for burrowing owl were not conducted; however, small mammal and desert kit fox burrows are present on site and could be suitable for nesting or wintering. Therefore, suitable nesting and foraging habitat exists within the BSA and the species could occupy the BSA prior to construction. Potentially significant direct impacts may occur to nesting or wintering burrowing owls during vegetation removal and ground-disturbance activities. To comply with the California Fish and Game Code and MBTA, a pre‐construction survey would be conducted according to the Staff Report on Burrowing Owl Mitigation (CDFW 2012) (or most recent guidance) to evaluate the

[3] CDFW considers round-tailed squirrel – Mohave ground squirrel hybrids to be a protected species under CESA.

[4] Although this species does not have any federal or state designation, Section 4000 of the California Fish and Game Code defines "kit fox" as a fur-bearing mammal and it is therefore considered "special-status" for purposes of this report.

locations of potential burrowing owl burrows within the project limits so take of owls or active owl nests can be avoided. **MM-BIO-3** (Pre-Construction Surveys for Burrowing Owl Avoidance) requires a pre-construction survey for burrowing owl in areas supporting potentially suitable habitat prior to the start of construction activities. A Burrowing Owl Management Plan would need to be prepared to facilitate implementation of this mitigation measure. With the implementation of **MM-BIO-3** (Pre-Construction Surveys for Burrowing Owl Avoidance) potential direct impacts to burrowing owl would be **less than significant with mitigation incorporated**.

Loggerhead Shrike

Loggerhead shrike was observed during the reconnaissance survey within the BSA. The BSA contains open habitats with scattered shrubs and trees suitable for nesting and foraging. Direct impacts to loggerhead shrike individuals from construction are generally unlikely due to its high mobility and access to adjacent habitat. Due to the amount of suitable nesting and foraging habitat occurring within the surrounding region, direct impacts to 99.8 acres of suitable nesting and foraging habitat for loggerhead shrike would be less than significant.

Potential significant direct impacts may occur to nesting loggerhead shrike during vegetation removal. Implementation of **MM-BIO-4** (Pre-Construction Nesting Bird Survey) would minimize potential direct impacts to a less-than-significant level through avoidance of vegetation removal during the nesting season (February 1 through August 31) and performance of a nesting bird survey if vegetation is removed during the nesting season. Therefore, direct impacts to nesting loggerhead shrike would be **less-than-significant with mitigation incorporated**.

LeConte's Thrasher

LeConte's thrasher has a moderate potential to occur within the BSA. The BSA contains desert scrub, with spiny shrub species such as *Lycium* and *Atriplex* that may provide suitable nesting and foraging habitat for LeConte's thrasher. Direct impacts to LeConte's thrasher individuals from construction are generally unlikely due to its high mobility and access to adjacent habitat. Due to the amount of suitable nesting and foraging habitat occurring within the surrounding region, direct impacts to 99.1 acres of suitable nesting and foraging habitat for LeConte's thrasher would be less than significant.

Potentially significant direct impacts may occur to nesting LeConte's thrasher during vegetation removal. Implementation of **MM-BIO-4** would minimize potential direct impacts to a less-than-significant level through avoidance of vegetation removal during the nesting season (February 1 through August 31) and performance of a nesting bird survey if vegetation is removed during the nesting season. Therefore, direct impacts to nesting LeConte's thrasher would be **less-than-significant with mitigation incorporated**.

Mohave Ground Squirrel

Focused surveys for Mohave ground squirrel resulted in the capture of round-tailed ground squirrels exhibiting some physical characteristics of Mohave ground squirrels (i.e., a flatter tail and brown dorsal pelage) within the BSA. These individuals may be a round-tailed ground squirrel–Mohave ground squirrel hybrid; however, genetic testing was not conducted to confirm if these individuals were hybrids. The CDFW has stated they consider any Mohave ground squirrel hybrid to be protected under CESA and impacts to any of these confirmed hybrid individuals would require authorization for take (Wood, pers. comm., 2024). Therefore, project implementation could result in potentially significant direct impacts to Mohave ground squirrel hybrid individuals and suitable habitat for these

individuals during vegetation removal and ground-disturbance activities. If present during construction, direct impacts to individuals and suitable habitat would be significant absent mitigation.

MM-BIO-5 (Mohave Ground Squirrel Avoidance and Minimization) requires pre-construction surveys to evaluate presence of the species. If pre-construction surveys or genetic testing (if such testing is available) are negative for the Mohave ground squirrel or Mohave ground squirrel hybrids, no further mitigation shall be required. Should presence be determined, **MM-BIO-5** provides minimization and avoidance measures for potential impacts to Mohave ground squirrel and Mohave ground squirrel hybrids. Section 2081 subdivision (b) of the Fish and Game Code allows CDFW to authorize take of species listed as endangered, threatened, or candidate pursuant to the California Endangered Species Act (CESA) through an incidental take permit (ITP). If needed, the ITP shall include an analysis of whether project impacts would jeopardize the continued existence of the species and shall provide suitable avoidance and minimization measures to reduce potential impacts. If required, the ITP shall provide compensatory mitigation for direct impacts to occupied Mohave ground squirrel, or Mohave ground squirrel hybrid, habitat at a minimum of 1:1 ratio through on- or off-site preservation with permanent protection and long-term funding or through purchase of equivalent credits through a mitigation bank if available.

Implementation of **MM-BIO-5** (Mohave Ground Squirrel Avoidance and Minimization) would reduce potential impacts to Mohave ground squirrel or Mohave ground squirrel hybrids, should any be determined to be present on site, to **less-than-significant with mitigation incorporated**.

Desert Kit Fox

An active desert kit fox burrow complex and tracks were incidentally observed on site by a Dudek biologists during the Mojave desert tortoise survey efforts. In addition, at least one individual desert kit fox was detected via the Mohave ground squirrel camera traps (Appendix B). Project implementation could have direct impacts on desert kit fox individuals and 99.1 acres of suitable habitat during vegetation removal and ground-disturbance activities. Direct impacts to individuals would be potentially significant absent mitigation. Due to the surrounding undeveloped lands available with comparable suitable habitat, the loss 99.1 acres of suitable habitat for desert kit fox would be less than significant.

To avoid potential direct impacts to desert kit fox, a pre-construction survey for desert kit fox would be conducted within 10 days prior to the start of construction to determine the presence/absence of desert kit fox, pursuant to **MM-BIO-6** (Pre-Construction Survey for Desert Kit Fox and Avoidance). To ensure that potential impacts to this species are less than significant, a desert kit fox relocation and mitigation plan would be prepared to facilitate implementation of this mitigation measure.

Implementation of **MM-BIO-6** (Pre-Construction Survey for Desert Kit Fox and Avoidance) would reduce potential direct impacts to desert kit fox to **less than significant with mitigation incorporated**.

Mohave Fringe-Toed Lizard

Mohave fringe-toed lizard has a high potential to occur within the BSA. The BSA contains areas of loose sand dune soils with shrubs and annual plants that may support arthropods, a part of the Mohave fringe-toed lizard diet. This species generally has low mobility to escape and therefore is susceptible to injury and mortality during construction activities. Impacts on individuals would be significant absent mitigation. Development of the project site would result in the loss of 99.1 acres of potential habitat for Mohave fringe-toed lizard. However, due to the surrounding

undeveloped lands available with comparable suitable habitat, the loss 99.1 acres of suitable habitat for Mohave fringe-toed lizard is considered less than significant.

Implementation of **MM-BIO-7** (Pre-Construction Clearance Survey) would reduce potential direct impacts to a less-than-significant level by requiring a pre-construction survey for special-status wildlife species using appropriate methods, avoidance of these species where possible, and relocation of individuals that may be captured. In addition, for any non-listed special-status wildlife species occurring in construction areas, buffers shall be established or, if establishing buffers is not feasible, attempts will be made to move the individuals to safety through capture and relocation or through encouraging them to leave the site. Therefore, direct impacts to Mohave fringe-toed lizard would be **less than significant with mitigation incorporated**.

Nesting Migratory Birds and Raptors

Similar to most other sites containing trees, shrubs, and other vegetation, the BSA contains opportunities for birds of prey (raptors) and other avian species to nest on site. Native nesting bird species with potential to occur within the BSA are protected by California Fish and Game Code Sections 3503 and 3503.5 and by the federal MBTA (16 USC 703–711). In particular, California Fish and Game Code Section 3503 provides that it is unlawful to take, possess, or needlessly destroy the active nests or eggs of any bird in California; Section 3503.5 protects all raptors and their eggs and active nests; and the MBTA prohibits the take (including killing, capturing, selling, trading, and transport) of native migratory bird species throughout the United States. Currently, California considers any nest that is under construction or modification or is supporting eggs, nestlings, or juveniles, as "active." Therefore, impacts to nesting migratory birds and raptors would be significant absent mitigation under CEQA.

To ensure compliance with the California Fish and Game Code and MBTA and to avoid potential impacts to nesting birds, vegetation removal activities would be conducted outside the general bird nesting season (February 1 through August 31, depending on the species); if vegetation cannot be removed outside the bird nesting season, a pre - construction nesting bird survey is required to be prepared by a qualified biologist prior to vegetation removal in compliance with the California Fish and Game Code and MBTA. Implementation of **MM-BIO-4** would reduce potential direct impacts to nesting migratory birds and raptors to **less than significant with mitigation incorporated**.

Indirect Impacts

Indirect impacts to special-status wildlife species are those that occur during construction to species present near the site but not within the construction zone. These include fugitive dust that can degrade habitat and result in health implications for wildlife species; noise and vibration that can stress wildlife species, cause them to leave an area of otherwise suitable habitat, or result in disruption of bird nesting and abandonment of nests; increased human presence, which can also disrupt daily activities of wildlife and cause them to leave an area; night-time lighting, which can disrupt the activity patterns of nocturnal species, including many mammals and some birds, amphibians, and reptiles; and release of chemical pollutants, such as from oil leaks from construction vehicles and machinery.

The project could result in significant, indirect impacts to six special-status wildlife species: burrowing owl, loggerhead shrike, LeConte's thrasher, Mohave ground squirrel, desert kit fox, and Mohave fringe-toed lizard. Therefore, potential indirect impacts to these species are further discussed below.

Burrowing Owl, Loggerhead Shrike, LeConte's Thrasher, and Nesting Migratory Birds and Raptors

Construction-Related: Potential short-term or temporary indirect impacts to burrowing owl, loggerhead shrike, LeConte's thrasher, and other nesting birds and raptors resulting from construction activities include the release of chemical pollutants; adverse effects from noise, vibration, and increased human presence; and night-time lighting. These potential construction-related indirect impacts to burrowing owl, loggerhead shrike, LeConte's thrasher and other nesting birds and raptors would be potentially significant absent mitigation.

Implementation of **MM-BIO-1** (Construction-Related Impacts to Special-Status Plants, Special-Status Wildlife, Sensitive Vegetation Communities, and Aquatic Resources) will minimize indirect impacts to burrowing owl, loggerhead shrike, LeConte's thrasher, and other nesting birds and raptors through biological monitoring, requirement of a Worker Environmental Awareness Training that will cover the special-status resources and mitigation requirements for the project, delineation of project boundaries, requiring all vehicles and equipment be serviced in designated staging areas, and ensuring that construction will not be conducted at night.

Therefore, implementation of **MM-BIO-1** would minimize the effect of construction-related indirect impacts to burrowing owl, loggerhead shrike, LeConte's thrasher, and other nesting birds and raptors to **less than significant with mitigation incorporated**.

Long-Term: Potential long-term, indirect impacts that could result from development to suitable habitat for burrowing owl, loggerhead shrike, LeConte's thrasher, and other nesting birds and raptors include chemical releases such as oils and grease from vehicles that could degrade habitat; increased invasive plant species that may degrade habitat; and trampling of vegetation and soil compaction by humans, which could affect soil moisture, water penetration, surface flows, and erosion. These potential long-term indirect impacts to suitable habitat for burrowing owl, loggerhead shrike, LeConte's thrasher, and other nesting birds and raptors would be potentially significant absent mitigation.

Implementation of **MM-BIO-2** (Long-Term Impacts to Special-Status Plants, Special-Status Wildlife, and Sensitive Vegetation Communities) would reduce potential indirect impacts to a less-than-significant level by requiring measures to ensure runoff is not altered from existing conditions and toxicants are not discharged, restoration of temporary impacts, preparation of landscaping plans that will emphasize native species and not include species from the Cal-IPC California Invasive Plant Inventory (Cal-IPC 2006), incorporation of barriers to prevent unauthorized public access to areas with potential habitat, and stipulations that night-lighting will not be directed towards open space areas. Therefore, implementation of **MM-BIO-2** would minimize the effect of long-term indirect impacts to burrowing owl, loggerhead shrike, LeConte's thrasher, and other nesting birds and raptors to **less than significant with mitigation incorporated**.

Mohave Ground Squirrel

Construction-Related: Potential short-term or temporary indirect impacts to Mohave ground squirrel or Mohave ground squirrel hybrids resulting from construction activities include the release of chemical pollutants; generation of fugitive dust; adverse effects from noise, vibration, and increased human presence; and night-time lighting. These potential construction-related indirect impacts to Mohave ground squirrel or Mohave ground squirrel hybrids would be potentially significant absent mitigation.

Project implementation of **MM-BIO-1** (Construction-Related Impacts to Special-Status Plants, Special-Status Wildlife, Sensitive Vegetation Communities, and Aquatic Resources) would reduce potential indirect impacts to a less-than-significant level through biological monitoring, requirement of a Worker Environmental Awareness Training that will cover the special-status resources and mitigation requirements for the project, delineation of project boundaries, development of a SWPPP, implementation of standard dust control measures, requiring all vehicles and equipment be serviced in designated staging areas, and ensuring that construction will not be conducted at night. In addition, project implementation of **MM-BIO-5** (Mohave Ground Squirrel Avoidance and Minimization) would minimize indirect impacts from noise, vibration, and increased human presence.

Therefore, implementation of **MM-BIO-1** and **MM-BIO-5** would minimize the effect of construction-related indirect impacts to Mohave ground squirrel to **less than significant with mitigation incorporated**.

Long-Term: Potential long-term, indirect impacts that could result from development to suitable habitat for Mohave ground squirrel or Mohave ground squirrel hybrids include chemical releases such as oils and grease from vehicles that could degrade habitat; increased invasive plant species that may degrade habitat; and trampling of vegetation and soil compaction by humans, which could affect soil moisture, water penetration, surface flows, and erosion. These potential long-term indirect impacts to suitable habitat for Mohave ground squirrel would be potentially significant absent mitigation.

Implementation of **MM-BIO-2** (Long-Term Impacts to Special-Status Plants, Special-Status Wildlife, and Sensitive Vegetation Communities) would reduce potential indirect impacts to a less-than-significant level by requiring measures to ensure runoff is not altered from existing conditions and toxicants are not discharged, restoration of temporary impacts, preparation of landscaping plans that will emphasize native species and not include species from the Cal-IPC California Invasive Plant Inventory (Cal-IPC 2006), incorporation of barriers to prevent unauthorized public access to areas with potential habitat, and stipulations that night-lighting will not be directed towards open space areas.

Therefore, implementation of recommended **MM-BIO-2** would minimize the effect of long-term indirect impacts to Mohave ground squirrel to **less-than-significant with mitigation incorporated**.

Desert Kit Fox

Construction-Related: Potential short-term or temporary indirect impacts to desert kit fox resulting from construction activities include the release of chemical pollutants; generation of fugitive dust; adverse effects from noise, vibration, and increased human presence; and night-time lighting. These potential construction-related indirect impacts to desert kit fox would be potentially significant absent mitigation.

Project implementation of **MM-BIO-1** (Construction-Related Impacts to Special-Status Plants, Special-Status Wildlife, Sensitive Vegetation Communities, and Aquatic Resources) would reduce potential indirect impacts to a less-than-significant level through biological monitoring, requirement of a Worker Environmental Awareness Training that will cover the special-status resources and mitigation requirements for the project, delineation of project boundaries, development of a SWPPP, implementation of standard dust control measures, requiring all vehicles and equipment be serviced in designated staging areas, and ensuring that construction will not be conducted at night. In addition, project implementation of recommended **MM-BIO-6** (Pre-Construction Survey for Desert Kit Fox and Avoidance) would result in identification and relocation of any desert kit fox within areas

potentially impacted by the project, which would minimize indirect impacts from noise, vibration, and increased human presence.

Therefore, implementation of recommended **MM-BIO-1** and **MM-BIO-6** would minimize the effect of construction-related indirect impacts to desert kit fox to **less than significant with mitigation incorporated**.

Long-Term: Potential long-term indirect impacts that could result from development near desert kit fox or their suitable habitat include chemical releases such as oils and grease from vehicles that could degrade habitat; increased human presence that could lead to unauthorized access to potential habitat for desert kit fox; increased invasive plant species that may degrade habitat; trampling of vegetation and soil compaction by humans, which could affect soil moisture, water penetration, surface flows, and erosion; and night-time lighting. These potential long-term indirect impacts to desert kit fox would be potentially significant absent mitigation.

Project implementation of **MM-BIO-2** (Long-Term Impacts to Special-Status Plants, Special-Status Wildlife, and Sensitive Vegetation Communities) would reduce potential indirect impacts to a less-than-significant level by requiring measures to ensure runoff is not altered from existing conditions and toxicants are not discharged, restoration of temporary impacts, preparation of landscaping plans that will emphasize native species and not include species from the Cal-IPC California Invasive Plant Inventory (Cal-IPC 2006), incorporation of barriers to prevent unauthorized public access to areas with potential habitat for desert kit fox, and stipulations that night-lighting will not be directed towards open space areas.

Therefore, implementation of **MM-BIO-2** would minimize the effect of long-term indirect impacts to desert kit fox to **less than significant with mitigation incorporated**.

Mohave Fringe-Toed Lizard

Construction-Related: Potential short-term or temporary indirect impacts to Mohave fringe-toed lizard resulting from construction activities include the release of chemical pollutants; generation of fugitive dust; adverse effects from noise, vibration, and increased human presence; and night-time lighting. These potential construction-related indirect impacts to Mohave fringe-toed lizard would be potentially significant absent mitigation.

Project implementation of recommended **MM-BIO-1** (Construction-Related Impacts to Special-Status Plants, Special-Status Wildlife, Sensitive Vegetation Communities, and Aquatic Resources) would reduce potential indirect impacts to a less-than-significant level through biological monitoring, requirement of a Worker Environmental Awareness Training that will cover the special-status resources and mitigation requirements for the project, delineation of project boundaries, development of a SWPPP, implementation of standard dust control measures, requiring all vehicles and equipment be serviced in designated staging areas, and ensuring that construction will not be conducted at night. In addition, project implementation of **MM-BIO-7** (Pre-Construction Clearance Surveys) would result in identification and relocation of any Mohave fringe-toed lizard within areas potentially impacted by the project, which would minimize indirect impacts from noise, vibration, and increased human presence.

Therefore, implementation of **MM-BIO-1** and **MM-BIO-7** would minimize the effect of construction-related indirect impacts to Mohave fringe-toed lizard to **less than significant with mitigation incorporated**.

Long-Term: Potential long-term indirect impacts that could result from development near Mohave fringe-toed lizard or their suitable habitat include chemical releases such as oils and grease from vehicles that could degrade habitat;

increased human presence that could lead to unauthorized access to potential habitat for Mohave fringe-toed lizard; increased invasive plant species that may degrade habitat; trampling of vegetation and soil compaction by humans, which could affect soil moisture, water penetration, surface flows, and erosion; and night-time lighting. These potential long-term indirect impacts to Mohave fringe-toed lizard would be potentially significant absent mitigation.

Project implementation of **MM-BIO-2** (Long-Term Impacts to Special-Status Plants, Special-Status Wildlife, and Sensitive Vegetation Communities) would reduce potential indirect impacts to a less-than-significant level by requiring measures to ensure runoff is not altered from existing conditions and toxicants are not discharged, restoration of temporary impacts, preparation of landscaping plans that will emphasize native species and not include species from the Cal-IPC California Invasive Plant Inventory (Cal-IPC 2006), incorporation of barriers to prevent unauthorized public access to areas with potential habitat for Mohave fringe-toed lizard, and stipulations that night-lighting will not be directed towards open space areas.

Therefore, implementation of **MM-BIO-2** would minimize the effect of long-term indirect impacts to Mohave fringe-toed lizard to **less than significant with mitigation incorporated**.

6.3.2 Impact BIO-2: Sensitive Vegetation Communities

6.3.2.1 Direct Impacts

A total of 102.15 acres would be directly impacted by project implementation (Figure 8, Project Impacts). As stated in Section 5.1, Vegetation Communities and Land Covers, CDFW state rankings of 1, 2, and 3 are considered high priority for inventory or special-status and impacts to these communities typically require mitigation. The project site does not contain any sensitive vegetation communities; therefore, direct impacts to sensitive vegetation communities are not anticipated to occur, and no additional measures are recommended.

6.3.2.2 Indirect Impacts

Construction-Related: The undeveloped areas adjacent to the project site are similar to those on site—allscale scrub and creosote bush–all scale scrub. Since these are not sensitive vegetation communities, there would be no short-term indirect impacts to sensitive vegetation communities outside of the project area, and no additional measures are recommended.

Long-Term: The undeveloped areas adjacent to the project site are similar to those on site—allscale scrub and creosote bush– scrub. Since these are not sensitive vegetation communities, there would be no long-term indirect impacts to sensitive vegetation communities outside of the project area, and no additional measures are recommended.

6.3.3 Impact BIO-3: State or Federally Protected Wetlands

6.3.3.1 Direct Impacts

There are no potential aquatic resources within the BSA, including state or federally protected wetlands. Therefore, there are no direct impacts are associated with this resource and no mitigation required with project implementation.

6.3.3.2 Indirect Impacts

Construction-Related: There are no potential waters or wetland waters of the U.S. or state on site. Additionally, the National Hydrography Dataset and National Wetlands Inventory do not identify any potential resources immediately surrounding the project site (Figure 4, Hydrologic Setting). Therefore, there would be no short-term indirect impacts to state or federally protected waters or wetlands.

Long-Term: There are no potential waters or wetland waters of the U.S. or state on site. Additionally, the National Hydrography Dataset and National Wetlands Inventory do not identify any potential resources immediately surrounding the project site (Figure 4, Hydrologic Setting). Therefore, there would be no long-term indirect impacts to state or federally protected waters or wetlands.

6.3.4 Impact BIO-4: Wildlife Corridors and Habitat Linkages

6.3.4.1 Direct Impacts

The BSA is currently undeveloped land located within established wildlife corridors and/or habitat linkage areas (i.e., the San Bernardino Mountains–Calico Mountains Essential Connectivity Area, the Desert Tortoise Conservation Area/Least Cost Corridor, and South Coast Wildlands Desert Linkage Network) that allow for viable populations of terrestrial species and/or species dispersal movements through the vicinity. However, the BSA is immediately adjacent to Lenwood Road along the western boundary, a residential area abuts the southern boundary, and rural residential areas are north and south of the site. Therefore, wildlife movement through the BSA's vicinity is, to some extent, restricted. The only relatively unrestricted areas are along the Mojave River to the north of the BSA and undeveloped land to the west of the BSA. Surveys for Mojave desert tortoise were negative, indicating the BSA is not used by this species. Surveys within the BSA determined that there are possible round-tailed–Mohave ground squirrel hybrids utilizing the project site, as well as desert kit fox, a variety of small mammals, reptiles, and birds. If wildlife enters the BSA, movement directly north, east, and south is restricted by development, railroads, and roads. Additionally, the site is mapped as "less permeable" by CDFW (2025) (Figure 6, Wildlife Movement) which means the habitat has lower ecological conditions and is less permeable to ecological flows. Areas mapped as such typically do not support sustainable wildlife movements between high-value ecological areas and protected areas or ecological flows.

As shown on Figure 6, Wildlife Movement, areas outside the project site that are part of established wildlife corridors and/or habitat linkages and that currently support wildlife movement in the region would not be impacted by the project and would continue to allow for wildlife movement through the vicinity after project completion. Furthermore, the BSA does not contain nursery sites, such as bat colony roosting sites or colonial bird nesting areas. Therefore, impacts to wildlife movement would be **less than significant**.

6.3.4.2 Indirect Impacts

Construction-Related: The undeveloped areas adjacent to the BSA are similar to those on the project site. Since the surrounding area is mapped the same as the project site, there would be no short-term indirect impacts to wildlife movement outside of the BSA, and no additional measures are recommended.

Long-Term: The undeveloped areas adjacent to the project site are similar to those on site. Since the surrounding area is mapped the same as the BSA, there would be no long-term indirect impacts to wildlife movement outside of the project area, and no additional measures are recommended.

6.3.5 Impact BIO-5: Local Policies and Ordinances

As previously discussed in Section 2.3.1 of this report, the project must comply with Chapter 88.01.060, Desert Native Plant Protection of the County's Development Code which focuses on the conservation of specified desert plant species. Survey efforts within the BSA resulted in the detection of at least one silver cholla, which is protected under the CDNPA as well as this Development Code. All silver cholla present within the BSA would be directly removed by project activities (Figure 8, Project Impacts), which would be considered a potentially significant impact, absent mitigation, due to a conflict with the California Desert Native Plants Act and with the County's Development Code.

Pursuant to **MM-BIO-8** (Pre-Construction Survey and Removal Permit for Desert Native Plants), a preconstruction survey for protected native desert plants within the BSA would be conducted to ensure all individuals are accurately counted. Should this survey result in the detection of any protected native desert plants within the BSA, the project applicant would submit an application and applicable fee paid to the San Bernardino County for removal of all protected native desert plants as listed within the CDNPA and Chapter 88.01.060 of the County's Development Code. The application would include certification from a qualified native desert plant expert that the proposed removal of protected native desert plants is appropriate, supportive of a healthy environment, and in compliance with the County's Development Code.

Section 88.01.080 of the Development Code focuses on promoting the health of riparian corridors in relation to their impact on waterways within the region, their use as habitat by various plant and wildlife species, and their stabilization of stream banks, and Chapter 88.02 of the Development Code provides a regulatory framework to promote the health of soil communities within the County, limits soil erosion potential, and preserves air quality.

There are no riparian corridors present within the BSA; therefore, the project is in compliance with Section 88.01.080 of the Development Code. Implementation of **MM-BIO-1** (Construction-Related Impacts to Special-Status Plants, Special-Status Wildlife, Sensitive Vegetation Communities, and Aquatic Resources) and **MM-BIO-2** (Long-Term Impacts to Special-Status Plants, Special-Status Wildlife, and Sensitive Vegetation Communities) would help implement standard dust control measures, minimize runoff, and require soil stabilization and would limit soil erosion and help preserve air quality.

The project may result in significant impacts to California desert native plants protected by state and local plant and tree preservation regulations, should they be present within the BSA. The project would also result in significant impacts to the health of soils communities within the County as listed in Chapter 88.08 of the San Bernardino County Development Code, absent mitigation. However, implementation of **MM-BIO-1**, **MM-BIO-2**, and **MM-BIO-8** would reduce potential impacts to California desert native plants and the soil community to **less-than-significant with mitigation incorporated**.

6.3.6 Impact BIO-6: Habitat Conservation Plans

There are no adopted habitat conservation plans overlapping the project site. Therefore, the proposed project is not in conflict with any habitat conservation plans or natural community conservation plans nor would it prevent any habitat conservation plans or natural community conservation plans from being approved. There would be **no impact,** and no mitigation measures are required.

INTENTIONALLY LEFT BLANK

7 Mitigation

The mitigation measures provided below are recommended to reduce potential direct and indirect impacts to biological resources, which will be further evaluated in the CEQA document.

MM-BIO-1 Construction-Related Impacts to Special-Status Plants and Special-Status Wildlife. Prior to issuance of a construction permit, construction plans and conditions of approval shall include the following to address indirect impacts to special-status species:

- **Biological Monitoring.** A qualified project biologist shall monitor ground-disturbing and vegetation clearing activities for the duration of construction to ensure that practicable measures are being employed to avoid incidental disturbance of habitat, species of concern, and other sensitive biological resources outside the project footprint. Once ground-disturbing and vegetation clearing activities are complete, the project biologist shall conduct weekly checks in order to inspect construction fencing and ensure that all applicable requirements from the mitigation measures are being upheld. The qualified project biologist shall have authority to immediately stop any activity that does not comply with the biological resources mitigation measures.
- **Worker Environmental Awareness Training.** Prior to grading, a pre-construction meeting shall be required that includes a training session for project personnel by a qualified biologist. The training shall include (1) a description of the species of concern and its habitats; (2) the general provisions of the applicable regulations pertaining to biological resources, including the federal and California Endangered Species Act and the Clean Water Act; (3) the need to adhere to the provisions of the Endangered Species Act, the Clean Water Act, and other applicable regulations; (4) the penalties associated with violating the provisions of the Endangered Species Act, Clean Water Act, and other applicable regulations; (5) the general measures that are being implemented to conserve the species of concern as they relate to the project; and (6) the access routes to and project site boundaries within which the project activities must be accomplished. Additionally, the training shall include the measures and mitigation requirements for the applicable resources. Copies of the mitigation measures and any required permits from the resource agencies shall be made available to construction personnel.
- **Delineation of Property Boundaries.** Prior to construction activities that would cause impacts, the contractor shall, in consultation with the biological monitor, clearly delineate the boundaries with fencing, stakes, or flags, consistent with the grading plan, within which the impacts shall take place. All impacts outside the fenced, staked, or flagged areas shall be avoided and all fencing, stakes, and flags shall be maintained until the completion of impacts in that area. In addition, any avoided environmental resources (if applicable) shall be clearly delineated. Prior to implementing construction activities, the biological monitor shall verify that the flagging clearly delineates the construction limits and any sensitive environmental resources to be avoided.
- **Standard Dust Control Measures.** Standard dust control measures shall be implemented in accordance with the Mojave Desert Air Quality Management District's Rules 401 and 403.2 to reduce impacts on nearby plants and wildlife. Measures include controlling speed to 25 mph or less on unpaved roads (including signage), replacing ground cover in disturbed areas as quickly as possible, frequently watering active work sites, installing shaker plates, and suspending excavation and grading operations during periods of high winds.

- **Stormwater Pollution Prevention Plan.** Prior to issuance of a grading permit for construction, the applicant shall submit a stormwater pollution prevention plan (SWPPP) to San Bernardino County that specifies best management practices to prevent all construction pollutants from contacting stormwater, with the intent of keeping sedimentation or any other pollutants from moving off site and into receiving waters. The requirements of the SWPPP shall be incorporated into design specifications and construction contracts. Best management practice categories employed on site would include erosion control, sediment control, and non-stormwater (good housekeeping). Best management practices recommended for the construction phase shall include, but not be limited to, the following:
  - Limiting grading to the minimum area necessary for construction and operation of the project
  - Limiting vegetation disturbance/removal to the maximum extent practicable
  - Implementing fiber rolls and sandbags around drainage areas and the site perimeter
  - Stockpiling and disposing of demolition debris, concrete, and soil properly
  - Installing a stabilized construction entrance/exit and stabilization of disturbed areas
  - Implementing proper protections for fueling and maintenance of equipment and vehicles
  - Managing waste, aggressively controlling litter, and implementing sediment controls
  - Stabilizing soil in disturbed areas by revegetation

  The following water quality measures will be included in the SWPPP to the extent applicable:

  - Erodible fill material shall not be deposited into water courses. Brush, loose soils, or other similar debris material shall not be stockpiled within the stream channel or on its banks.
  - Projects that cannot be conducted without placing equipment or personnel in sensitive habitats shall be timed to avoid the breeding season of riparian species.
  - When stream flows must be diverted, the diversions shall be conducted using sandbags or other methods requiring minimal instream impacts. Silt fencing or other sediment trapping materials shall be installed at the downstream end of construction activity to minimize the transport of sediments off site. Settling ponds where sediment is collected shall be cleaned out in a manner that prevents the sediment from reentering the stream. Care shall be exercised when removing silt fences, as feasible, to prevent debris or sediment from returning to the stream.
  - Water pollution and erosion control plans shall be developed and implemented in accordance with the Regional Water Quality Control Board.
- **Minimize Spills of Hazardous Materials.** All vehicles and equipment shall be maintained in proper condition to minimize the potential for fugitive emissions of motor oil, antifreeze, hydraulic fluid, grease, or other hazardous materials. Hazardous spills shall be immediately cleaned up and the contaminated soil shall be immediately cleaned up and the contaminated soil shall be properly handled or disposed of at a licensed facility. Servicing of construction equipment shall take place only at a designated staging area.
- **Wildlife Hazards.** The following measures shall be implemented to ensure that wildlife do not become trapped, entangled, injured, or poisoned by construction activities:

- Structures in which wildlife may become trapped (e.g., open pipes, pits, trenches, etc.) shall be tightly covered at the end of each work day. If covering the structure is not possible, an escape ramp shall be provided to allow any wildlife that falls in to safely escape.
- Debris piles, construction materials, equipment, and other items that may be used as wildlife refuge shall be inspected for wildlife at the start of each work day and prior to disturbance. If wildlife is discovered, it shall either be moved out of harm's way by a qualified biologist or allowed to move off of the project site on its own.
- Nets and mesh shall be made of loose weave material that is not fused at the intersections of the weave, as nets with welded weaves present an entanglement risk.
- Toxic materials and garbage shall be removed from the work site and safely stored or disposed of at the end of each work day.

- **Invasive Weeds.** In order to reduce the spread of invasive plant species, landscape plants shall not be on the most recent version of the California Invasive Plant Council California Invasive Plant Inventory (http://www.cal-ipc.org/ip/inventory/index.php).
- **Noise.** Proposed noise-generating land uses affecting suitable habitat for special-status species shall incorporate setbacks, berms, or walls to minimize the effects of noise on resources pursuant to applicable rules, regulations, and guidelines related to land use noise standards. For planning purposes, wildlife shall not be subject to noise that would exceed residential noise standards.
- **Night Work.** All construction activities shall be conducted during the daytime and lights shall not be kept on overnight in the construction area, as practicable. Should construction activities occur at night, the project applicant would be required to obtain authorization for nighttime work from the County. If night-lighting is required during construction activities, all exterior lighting along undeveloped land shall be fully shielded and directed downward in a manner that shall prevent light spillage or glare into the adjacent open space (undeveloped land).

MM-BIO-2 Long-Term Impacts to Special-Status Plants and Special-Status Wildlife. Prior to issuance of a construction permit, construction plans and conditions of approval shall include the following to address indirect impacts to special-status species and nesting birds and raptors:

- **Runoff.** The project shall implement measures required through the National Pollutant Discharge Elimination System requirements to ensure that the quantity and quality of runoff discharged is not altered in an adverse way when compared with existing conditions. In particular, measures shall be put in place to avoid discharge of untreated surface runoff from developed and paved areas into open space (undeveloped land) or suitable habitat for special-status species. Stormwater systems shall be designed to prevent the release of toxins, chemicals, petroleum products, exotic plant materials, or other elements that might degrade or harm biological resources or ecosystem processes. This can be accomplished using a variety of methods including natural detention basins, grass swales, or mechanical trapping devices. Regular maintenance shall occur to ensure effective operations of runoff control systems.
- **Toxicants.** Land uses that use chemicals or generate bioproducts such as manure, fertilizer, or vineyard waste that are potentially toxic or may adversely affect plant species, wildlife species, habitat, or water quality shall incorporate measures to ensure that application of such

chemicals does not result in discharges. Measures such as those employed to address drainage issues shall be implemented.

- **Noise.** Proposed noise-generating land uses affecting suitable habitat for special-status species shall incorporate setbacks, berms, or walls to minimize the effects of noise on resources pursuant to applicable rules, regulations, and guidelines related to land use noise standards. For planning purposes, wildlife should not be subject to noise that would exceed residential noise standards.
- **Barriers.** The project shall incorporate barriers, where appropriate, to minimize unauthorized public access, domestic animal predation, illegal trespass, or dumping in open space and/or suitable habitat for special-status wildlife. Such barriers may include native landscaping, rocks/boulders, fencing, walls, signage, and/or other appropriate mechanisms.
- **Invasive Species.** Invasive, non-native plant species listed on the most recent California Invasive Plant Council inventory (https://www.cal-ipc.org/plants/inventory/) with a rating of moderate or high shall not be included in landscaping.

MM-BIO-3 Pre-Construction Surveys for Burrowing Owl and Avoidance. One pre-construction burrowing owl take avoidance survey shall be completed by a qualified biologist no less than 14 days before initiation of site preparation or grading activities. A second take avoidance survey shall be completed within 24 hours prior to the start of site preparation or grading activities. If ground-disturbing activities are delayed or suspended for more than 30 days after the pre-construction surveys, the project site shall be resurveyed. Surveys for burrowing owl shall be conducted in accordance with protocols established in the California Department of Fish and Wildlife (CDFW) 2012 Staff Report on Burrowing Owl Mitigation. The surveys shall be conducted of the project site and adjoining habitat areas within 500-feet of the construction area. If burrowing owl are not detected during pre-construction surveys, and if no burrows or perch sites have active sign (molted feathers, cast pellets, prey remains, eggshell fragments, decoration, or excrement), then construction related activities may begin, no further action shall be required, and no further mitigation under this measure is necessary.

If burrowing owls are detected occupying the site, a Burrowing Owl Management Plan shall be prepared in consultation with CDFW. Unless otherwise approved by CDFW, disturbance to suitably sized burrows (>11 cm in diameter and >150 cm in depth) shall be avoided during the breeding season (February 1 through August 31) unless found to be unoccupied. Buffers shall be established around occupied burrows by a qualified biologist in accordance with guidance provided in CDFW's 2012 Staff Report on Burrowing Owl Mitigation and based on the level of disturbance and time of year. Buffers may be adjusted by a qualified biologist based on the level of disturbance, site-specific conditions (e.g., visual screens), and after consultation with CDFW. Fencing or flagging shall be installed to create a non-disturbance buffer area where no work activities may be conducted. The buffer shall remain in place in accordance with the Burrowing Owl Management Plan and until it is determined that the burrows are no longer occupied or the young from the occupied burrows are foraging independently and capable of independent survival.

If impacts to burrowing owl cannot be feasibly avoided or minimized through non-disturbance buffers during construction, the applicant shall consult with CDFW on whether take authorization under the California Endangered Species Act (CESA) Incidental Take Permit (ITP) process may be

warranted. If take authorization is necessary, the ITP shall include suitable avoidance and minimization measures to reduce potential impacts (e.g., maintenance of buffers during the breeding season and passive relocation), and adequate compensatory mitigation through conservation or mitigation banking. Unavoidable impacts to occupied suitable habitat shall be compensated at a minimum of 1:1 ratio (through on- or off-site preservation with permanent protection and long-term funding, or through purchase of equivalent credits through a mitigation bank, if available) in addition to implementing all other measures and conditions of the ITP.

MM-BIO-4 Pre-Construction Nesting Bird Surveys and Avoidance. Construction activities shall avoid the migratory bird nesting season (typically February 1 through August 31) to reduce any potential significant impact to birds that may be nesting in the survey area to the maximum extent feasible. If construction activities must occur during the migratory bird nesting season, an avian nesting survey of the project site and within 500 feet of the project site shall be conducted to determine the presence/absence of protected migratory birds and active nests. The avian nesting survey shall be performed by a qualified wildlife biologist within 72 hours prior to the start of construction in accordance with the Migratory Bird Treaty Act and California Fish and Game Code Sections 3503, 3503.5, and 3513. If an active bird nest is found, the nest shall be flagged and mapped on the construction plans, along with an appropriate buffer established around the nest, which shall be determined by the biologist based on the species' sensitivity to disturbance (typically 300 feet for passerines and 500 feet for raptors and special-status species). The nest area shall be demarcated in the field with flagging and stakes or construction fencing. On-site construction monitoring shall be conducted when construction occurs in close proximity to an active nest buffer. No project activities shall encroach into established buffers without the consent of a monitoring biologist. The nest area and buffer shall be avoided and remain in place until it is determined by a qualified biologist that the nestlings have fledged and the nest is vacated and no longer active.

MM-BIO-5 Mohave Ground Squirrel Avoidance and Minimization. To address potentially significant impacts to Mohave ground squirrel, the project applicant shall conduct pre-construction surveys to evaluate presence of the species. If pre-construction surveys or genetic testing (if such testing is available) are negative for the Mohave ground squirrel or Mohave ground squirrel hybrids, no further mitigation shall be required.

If the pre-construction surveys confirm presence on the site, or alternatively, if the applicant forgoes pre-construction surveys and presumes presence, the applicant shall consult with the California Department of Fish and Wildlife (CDFW) and obtain an Incidental Take Permit (ITP) under Section 2081 of California Fish and Game Code. The ITP shall provide, at a minimum, suitable take avoidance and minimization measures to reduce potential impacts, and adequate compensatory mitigation through conservation or mitigation banking. Unavoidable impacts to occupied suitable habitat shall be compensated at a minimum of 1:1 ratio (through on- or off-site preservation with permanent protection and long-term funding, or through purchase of equivalent credits through a mitigation bank if available) in addition to implementing all other measures and conditions of the ITP. For example, take minimization measures to be implemented shall include, at a minimum, a combination of the following: (1) preconstruction surveys of the project site and 50-foot buffer, (2) preparation of a Mohave Ground Squirrel Relocation Plan with specific methods and procedures for burrow excavation and ground squirrel relocation, and (3) reporting to the County and CDFW.

MM-BIO-6 Pre-Construction Survey for Desert Kit Fox and Avoidance. A pre-construction survey for desert kit fox shall be conducted by a qualified biologist within 10 days prior to initiation of site preparation or grading activities to determine the presence/absence of desert kit fox.

If desert kit fox is detected, a Desert Kit Fox Relocation and Mitigation Plan shall be implemented. The Desert Kit Fox Relocation and Mitigation Plan shall include, at a minimum, the following avoidance, minimization, and mitigation measures. If an active non-natal desert kit fox den is detected, a 200-foot no disturbance buffer shall be established around the active den, unless otherwise authorized by the California Department of Fish and Wildlife (CDFW). Where required buffering will not be feasible, passive relocation, as outlined in the Desert Kit Fox Relocation and Mitigation Plan, shall be allowed in consultation with San Bernardino County, CDFW, and U.S. Fish and Wildlife Service (USFWS). If an active natal desert kit fox den is detected, an initial 200 foot no disturbance buffer shall be established around the natal den, and this buffer shall be maintained until the den can be verified to not host pups. Construction activities shall not be permitted in this area until the den has been vacated. Once the den is vacated, and if threatened by construction, it can be collapsed if deemed necessary by a qualified biologist.

A report to evaluate the success of the relocation efforts and any subsequent re-occupation, if applicable, shall be provided (including a comprehensive summary, tables, maps, and other necessary materials) at the end of the construction period to CDFW, the USFWS and the County. Data shall be readily available to the CDFW upon request. If an injured, sick, or dead desert kit fox is detected on any area associated with the project, the designated CDFW personnel at both the Ontario office and the Wildlife Investigation Lab shall be notified as described within the Desert Kit Fox Relocation and Mitigation Plan.

MM-BIO-7 Pre-Construction Mohave Fringe-toed Lizard Clearance Surveys. Pre-construction clearance surveys for Mohave fringe-toed lizard shall be conducted by a qualified biologist within 48 hours of the initiation of ground disturbance or vegetation clearing within and adjacent to construction areas. If found, Mohave fringe-toed lizards shall be relocated to suitable habitat nearby where they are safe from construction activities. Surveys and relocation of these species may only be conducted by a qualified biologist.

- Suitable burrows or rock piles shall be checked for occupancy. Occupied burrows shall be flagged and avoided (employing a 50-foot buffer) during construction. If the burrow cannot be avoided, it shall be excavated and the occupant relocated to an unoccupied burrow outside the construction area and of approximately the same size as the one from which it was removed.
- During construction, if a Mohave fringe-toed lizard is found on the project site, construction activities adjacent to the individual's location shall be halted and the animal shall be allowed to move away from the construction site. If the individual is not moving, a qualified biologist shall relocate it to nearby suitable habitat outside the construction area. It shall be placed in the shade of a shrub.

MM-BIO-8 Pre-Construction Desert Native Plant Survey. Prior to the issuance of grading permits, the BSA shall undergo a preconstruction survey to obtain an accurate count of the total number of protected desert native plants within the BSA. Protected desert native plants include those listed in the CDNPA as well as those listed within Chapter 88.01.060 (*Desert Native Plant Protection)* of the County's Development Code, and is as follows:

- The following desert native plants with stems 2 inches or greater in diameter or 6 feet or greater in height:
  - *Psorothamnus spinosus* (smoketree).
  - All species of the genus *Prosopis* (mesquites).
- All species of the family *Agavaceae* (century plants, nolias, yuccas).
- Creosote Rings, 10 feet or greater in diameter.
- All Joshua trees.
- Any part of any of the following species, whether living or dead:
  - *Olneya tesota* (desert ironwood).
  - All species of the genus *Prosopis* (mesquites).
- All species of the genus *Cercidium* (palo verdes).

Should any of the above listed plants be observed within the BSA during the preconstruction survey, the project applicant shall submit an application and applicable fee paid to San Bernardino County for removal of said protected native desert plants. The application shall include certification from a qualified native desert plant expert to show that proposed removal or relocation of protected native desert plants are appropriate, supportive of a healthy environment, and in compliance with the San Bernardino County Development Code.

INTENTIONALLY LEFT BLANK

8 Level of Significance After Mitigation

All direct and indirect impacts to sensitive and special-status biological resources that would result from implementation of the proposed project would be either less than significant or less-than-significant after mitigation.

INTENTIONALLY LEFT BLANK

Mohave Ground Squirrel Protocol Survey Report

August 5, 2023

Callie Amoaku
Dudek
605 Third Street
Encinitas, CA 92024
Via email: cford@dudek.com

Subject: Results of Mohave Ground Squirrel Protocol Surveys for the Electric Vehicle (EV) Charging Truck Stop and Auto Distribution Center Project, Barstow, San Bernardino County, California

Dear Ms. Amoaku:

The purpose of this report is to document the results of a California Department of Fish and Wildlife (CDFW) protocol survey for Mohave ground squirrel (*Xerospermophilus mohavensis*; MGS) conducted by Dipodomys Ecological Consulting LLC (DEC) for the Electric Vehicle (EV) Charging Truck Stop and Auto Distribution Center Project (project). Presented in this report are a description of the project, project location, the biological setting of the site, MGS natural history, survey methodology, results of trapping efforts for MGS, and conclusions.

Project Description and Location

EVC Partners, LLC proposes to develop an electric vehicle charging station and auto distribution center on a 100-acre parcel. The 100-acre project is located within the City of Barstow in San Bernardino County. The project is bordered by Lenwood Road on the west, and Agate Road on the north. The southern and eastern boundaries of the project are bordered by an unnamed dirt road on the south and undeveloped desert land on the east (**Figures 1 and 2**). Surrounding land use includes a residential development to the south and a farmhouse to the north. The east and west portions of the site are surrounded by undeveloped desert land. The primary source of disturbance is past and current off-highway vehicle (OHV) activity. The project sites can be found on U.S. Geological Survey (USGS) 7.5-minute Barstow topographic quadrangle map within Section 8, Township 9 North and Range 2 West, as shown in **Figure 1**, Project Location.

Biological Setting

Four vegetation communities were identified within the project site including: fourwing saltbush scrub (36.310.000), allscale scrub (36.340.00), California jointfir-long leaf jointfir scrub (33.270.00) and creosote bush scrub (CDFW CA Code 33.010.00). Dominant plants present include creosote bush (*Larrea tridentata*), allscale saltbush (*Atriplex polycarpa*), spinescale saltbush (*Atriplex spinifera*), spiny saltbush (*Atriplex confertifolia*), fourwing salt bush *(Atriplex canescens*), pale desert thorn (*Lycium pallidum*), and long-leaved joint-fir (*Ephedra trifurca*). Herbaceous plants present onsite include red-stemmed filaree (*Erodium cicutarium*), rattlesnake weed (*Euphorbia albomarginata*), fiddleneck (*Amsinckia tessellata*), desert lupine (*Lupinus schockleyi*), broad leaved gilia (*Gilia latiflora*), yellow peppergrass (*Lepidium*

flavum), Russian thistle (*Salsola tragus*), short podded mustard (*Hirschfeldia incana*), desert pincushion (*Chaenactis fremontii*), crowned muilla (*Muilla coronata*), Mediterranean grass (*Schismus barbatus*) and foxtail brome (*Bromus madritensis*). Soil consists of sandy dunes and Cajon sand (WebSoil 2023). The project site is located at an elevation of approximately 2,182 feet above mean sea level (amsl).

Mohave Ground Squirrel Natural History

Mohave ground squirrels are medium-sized (210-230mm, 85-130g), diurnal squirrels. Their dorsal pelage is light gray to cinnamon-brown, while their ventral side is creamy. Unlike round-tailed ground squirrels, which occur sympatrically in the southeast portion of their range, MGS have a short, flat tail that is light-colored on its underside, and have brown cheeks instead of white.

MGS inhabit a small geographic area in the western Mojave Desert. This species ranges from Palmdale in the southwest, the Lucerne Valley in the southeast, Olancha in the northwest, and the Avawatz Mountains in the northeast (Gustafson 1993). Although occurrences in the southern portion of their range are rare, occurrences have been documented on the California Natural Diversity Database (CNDDB) as recently as 2011 (Figure 3). Vegetation communities (as classified by the California Native Plant Society) typically associated with MGS include Mojave Creosote Scrub, Shadscale Scrub, Desert Saltbush Scrub, Desert Sink Scrub, and Joshua Tree Woodland. MGS feed primarily on the leaves and seeds of forbs and shrubs. In the northern portion of their range, MGS have been found to feed on spiny hopsage (*Grayia spinosa*), winterfat (*Krascheninnikovia lanata*) and saltbush (*Atriplex* sp.), especially in early spring when forbs are unavailable, during summer when forbs have dried out, and during drought conditions (Leitner and Leitner 1998). Recent studies have also indicated that MGS feed on the following forbs and shrubs: freckled milkvetch (*Astragalus lentiginosus*), Mojave lupine (*Lupinus odoratus*), buckwheat (*Eriogonum* sp.), white mallow (*Eremalche exilis*), fiddleneck, Russian thistle, desert pincushion (*Chaenactis* sp.), Cryptantha (*Cryptantha pterocarya*), Coreopsis (*Leptosyne bigelovii*), Valley lessingia (*Lessingia glandulifera*), desert dandelion (*Malacothrix glabrata*), Phacelia (*Phacelia* sp.), wire lettuce (*Stephanomeria* sp.) Anderson's desert thorn (*Lycium andersonii*), spiny horsebrush (*Tetradimya spinosa*), and Joshua tree *(Yucca brevifolia*) (Leitner and Leitner 2017).

MGS have adapted to live in hot desert environments by limiting their activity aboveground through estivation and hibernation. The timing of emergence from hibernation varies by location: in the northern portion of their range male MGS emerge mid-March (Leitner and Leitner 1998); however, in the southern portion of their range, MGS may emerge as early as mid-January (Recht 1977). Throughout their active period, MGS store fat in preparation for estivation, which typically occurs between July and September, but may occur as early as April or May during drought conditions (Leitner et al. 1995). MGS reproduction is dependent on fall and winter rains and individuals may forgo breeding entirely if low rainfall (<80mm) results in reduced herbaceous plants (Leitner and Leitner 2017).

Throughout the range of MGS, they may co-occur with antelope ground squirrels (*Ammospermophilus leucurus*), round-tailed ground squirrels (*Xerospermophilus tereticaudus*) (**Table 1**), and California ground squirrels (*Otospermophilus beecheyi*). MGS may be misidentified with round-tailed ground squirrels, but this is unlikely to occur with antelope ground squirrels, because the latter species has white dorsal stripes that makes them resemble a chipmunk more than an MGS. California ground squirrels are also notably larger and are not typically confused with MGS.

MGS are classified as threatened and are protected under the California Endangered Species Act. Primary threats to MGS include limited distribution, low abundance, and habitat loss from by converting suitable habitat to urban, suburban, agricultural and military land uses (Gustafson 1993, Leitner and Leitner 2017).

TABLE 1
RTGS AND MGS CHARACTERISTICS

	RTGS	MGS
Head and body length (mm)	130-181	128-165
Tail length (mm)	70-112	50-72
Weight (g)	110-200	70-300
Back pelage appearance	Back dull gray brown or pale cinnamon	Back pale pinkish brown finely flecked with white
Tail appearance	Tail long and narrow, round in profile	Tail narrow at base, tufted and somewhat banded near tip, flattened in profile
Tail color	Edge and underside pale brown	Edge and underside of tail white
Social structure	Semi-colonial	Solitary except when breeding

Methods

Mohave ground squirrel (MGS) Protocol surveys for the EV Charging Truck Stop and Auto Distribution Center Project MGS were conducted in accordance with the 2010 CDFW MGS Survey Guidelines and consisted of an initial visual survey followed by live trapping and camera trapping efforts. Details for each survey type are described below.

Visual Survey

An initial review of the California Natural Diversity Database (CNDDB) was conducted prior to the visual assessment to determine the historical recorded occurrences of MGS near the project site (**Figure 3**). The visual survey was conducted by Principal Investigator Karla Flores (MOU and Scientific Collection Permit SC-10572) and Principal Investigator Karl Fairchild (SCP S-182820007-18333-001) on March 14, 2023. The visual survey consisted of driving and walking throughout the project site to identify suitable habitat for MGS. This included identifying plants known to provide forage material for MGS such as spiny hopsage, winterfat, Cooper's boxthorn, Anderson's desert thorn, and Joshua tree (Leitner 2022). Areas supporting suitable habitat for MGS where these plants are concentrated were recorded on an aerial map. Suitable soil types for burrowing and burrow densities were also noted.

Live Trapping

Live trapping surveys were conducted by Karla Flores and consisted of setting up two 50-trap 5x10 survey grids (140mx315m) within the northern and southern portions of the project parcel. Both grids encompassed representative habitat types. Coordinate locations for the northern and southern grids are listed in **Table 2**. Traps in each grid were spaced 35 meters apart and utilized XLK Sherman live-traps (3x3.75x12") with accompanying A-frame cardboard shade covers staked to the ground with metal tent stakes. All traps were baited with 4-way livestock feed and peanut butter powder and were opened within one hour of sunrise and were checked no more than every four hours. All traps were closed within hour of sunset. Trapping was conducted when temperatures were between 50- and 90-degrees Fahrenheit, and

inclement conditions (rain, thunderstorms) were not present. All animals captured were released at their capture location, and the following information recorded for each capture: species, weight, age, sex, and reproductive condition. Live-trapping surveys were conducted for a period of five days in each of the three survey windows established by the MGS survey guidelines (1st: March 15-April 3; 2nd May 1-31;3rd June 15-July 15). Details for each survey period are presented in **Table 3.** MGS Survey and Trapping Forms, including weather details, are presented in **Attachment A** and **Attachment B**.

Beginning in Session 1, some of the squirrels captured displayed characteristics of RTGS/MGS hybrids. Because of the potential for the hybrid animals to be considered a positive MGS finding, DEC notified Dudek and CDFW on March 21, 2023, and began collecting ear tissue samples for genetic analysis. On May 18, 2023, CDFW notified DEC that CDFW would consider the observations of hybrid animals a positive finding, but that a second trapping session should be conducted to obtain additional tissue samples. As a result of the positive finding, a third trapping session was not conducted.

LT: Live Trapping CT: Camera Trapping

Camera Trapping

Camera trapping surveys were used to supplement live-trapping efforts and consisted of setting up five camera trapping stations throughout the project site (**Figure 2**). Each camera trap station consisted of a Bushnell Core Low Glow Trail Camera (Model 1199932CB) secured to a 36-inch U-post facing a bait station. The bait station consisted of a feeding tube filled with 4-way livestock feed staked to the ground with a 12-inch railroad spike. Cameras operated 24 hours a day, concurrent with live-trapping surveys, and followed the set-up specifications described in Delaney et al. 2017. Coordinate locations for each camera trap station are listed below in **Table 4**.

Photos from the camera trap stations were downloaded and reviewed by the Principal Investigator after every five-day trapping session. A list of species detected at the camera trap stations is included in **Table 5**.

Results

Visual Survey

Based on the habitat data collected during the visual survey, MGS habitat is present onsite. Primary MGS food plants such as winterfat are not present onsite. However, other plants identified as being associated with MGS in microhistology and metabarcoding studies (Leitner 2022) are present onsite, these include: creosote bush, fourwing saltbush, allscale, spinescale, spiny saltbush, and fiddleneck. Visual observations of burrows and burrow complexes showed that soil onsite is suitable for burrowing.

Live Trapping

Live-trapping captures consisted of white-tailed antelope ground squirrel, round-tailed ground squirrel (RTGS), and round-tailed ground squirrel-Mohave ground squirrel hybrids (*Xerospermophilus tereticaudus-Xerospermophilus mohavensis*; RTGS-MGS) (**Table 5; Figure 4**). Ear tissue samples from each hybrid were collected for subsequent DNA analysis at the University of Nevada, Reno.

TABLE 5
RESULTS OF MOHAVE GROUND SQUIRREL PROTOCOL SURVEYS

Common name	Scientific name	Session			Total
		1	2	3	
Round-tailed ground squirrel	*Xerospermophilus tereticaudus*	5	1	N/A	6
RTGS-MGS Hybrids	*Xerospermophilus tereticaudus-mohavensis*	11	9	N/A	20
White-tailed antelope ground squirrel	*Ammospermophilus leucurus*	10	9	N/A	19
	Total	26	19		**45**

Camera Trapping

No Mohave ground squirrels were detected in the images collected during the camera trapping surveys. Ten species were observed utilizing the camera trap stations and included: white-tailed antelope ground squirrel, domestic dog, coyote, spiny pocket mouse, kangaroo rat, desert iguana, California ground squirrel, silky pocket mouse, desert cottontail, side-blotched lizard, and desert kit fox (**Table 5**).

TABLE 6
RESULTS OF MOHAVE GROUND SQUIRREL CAMERA TRAPPING

Common Name	Scientific Name
White-tailed antelope ground squirrel	*Ammospermophilus leucurus*
Domestic dog	*Canis familiaris*
Coyote	*Canis latrans*
Spiny pocket mouse sp.	*Chaetodipus sp.*
Kangaroo rat sp.	*Dipodomys sp.*
Desert iguana	*Dipsosaurus dorsalis*
California ground squirrel	*Otospermophilus beecheyi*
Silky pocket mouse sp.	*Perognathus sp.*
Desert cottontail	*Sylvilagus audubonii*
Side-blotched lizard	*Uta stansburiana*
Desert kit fox	*Vulpes macrotis*

Conclusions

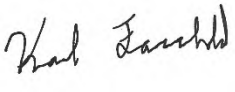
The Electric Vehicle (EV) Charging Truck Stop and Auto Distribution Center Project is located within the eastern portion of the MGS range and is an area known to have sympatric populations of MGS and RTGS. This area is also known to support RTGS and MGS hybrids.

Additionally, the site is located near the Harper Lake MGS core population area as well as the Coolgardie Mesa-Superior Valley core population area and associated peripheral population areas described in the 2019 CDFW MGS Conservation Strategy. California Natural Diversity Database (CNDDB) occurrence details for MGS in the vicinity of the project site (**Figure 3**), indicate that MGS are historically present in the vicinity of the project, but may be extirpated in the immediate project area, and areas to the south and east, potentially due to development and habitat fragmentation. The nearest MGS occurrence to the project site was recorded 1.25 miles north of the project site in 1990. The most recent occurrence of MGS was recorded in 2012, approximately 3.3 miles northwest of the project.

Based on the historical records of MGS occurrences and the presence of RTGS-MGS hybrids, it is likely that a population of MGS was present in the near the project in the near past. Although genetic analysis will confirm the presence of RTGS-MGS hybrids, CDFW has indicated that presence of hybrids onsite will be considered a positive finding by the agency and an incidental take permit (ITP) may be required for future development onsite.

I hereby certify that the information in this report is true, and that it conforms to accepted biological standards. Please feel free to contact Karla Flores by phone at (619) 972-4319 or by email at kflores@dipodomysecological.com or Karl Fairchild by phone at (541) 609-1038 or by email at kfairchild@dipodomysecological.com, with any questions regarding this report.

Sincerely,



Karla L. Flores
Principal Investigator

ASTERACEAE—Sunflower Family
- Ambrosia acanthicarpa—flatspine bur ragweed
- Ambrosia dumosa—white bursage
- Chaenactis fremontii—pincushion flower
- Dicoria canescens—desert twinbugs

BORAGINACEAE—Borage Family
- Amsinckia intermedia—common fiddleneck
- Amsinckia tessellata var. tessellata—bristly fiddleneck
- Amsinckia tessellata—bristly fiddleneck
- Heliotropium curassavicum var. oculatum—seaside heliotrope

BRASSICACEAE—Mustard Family
- Hirschfeldia incana—shortpod mustard*
- Sisymbrium altissimum—tall tumblemustard*

CACTACEAE—Cactus Family
- Cylindropuntia echinocarpa—silver cholla

CHENOPODIACEAE—Goosefoot Family
- Atriplex canescens—fourwing saltbush
- Atriplex confertifolia—shadscale
- Atriplex polycarpa—allscale
- Atriplex spinifera—spinescale
- Salsola tragus—prickly Russian thistle*
- Stutzia covillei—no common name
- Suaeda nigra—bush seepweed

GERANIACEAE—Geranium Family
- Erodium cicutarium—redstem stork's bill*

MALVACEAE—Mallow Family
- Eremalche parryi—Parry's mallow

POLEMONIACEAE—Phlox Family
- Eriastrum eremicum ssp. eremicum—desert woollystar
- Gilia latiflora—hollyleaf gilia

POLYGONACEAE—Buckwheat Family
- Chorizanthe rigida—rigid spineflower
- Chorizanthe spinosa—Mojave spineflower

SOLANACEAE—Nightshade Family
- Lycium brevipes—Baja desert-thorn

Lycium cooperi—peach thorn
Lycium pallidum—pale desert-thorn
TAMARICACEAE—Tamarisk Family
Tamarix ramosissima—tamarisk*
ZYGOPHYLLACEAE—Caltrop Family
Larrea tridentata—creosote bush

GYMNOSPERMS AND GNETOPHYTES

EPHEDRACEAE—Ephedra Family
Ephedra nevadensis—Nevada joint fir
Ephedra trifurca—longleaf joint-fir

MONOCOTS

POACEAE—Grass Family
Bromus rubens—red brome*
Cynodon dactylon—Bermudagrass*
Hordeum murinum—mouse barley*
Schismus barbatus—common Mediterranean grass*

Appendix E
Wildlife Compendium

Wildlife Species

Birds

Blackbirds, Orioles and Allies

ICTERIDAE – BLACKBIRDS

Sturnella neglecta – western meadowlark

* *Molothrus ater* – brown-headed cowbird

Falcons

FALCONIDAE – CARACARAS AND FALCONS

Falco sparverius – American kestrel

Finches

FRINGILLIDAE – FRINGILLINE AND CARDUELINE FINCHES AND ALLIES

Haemorhous mexicanus – house finch

Spinus psaltria – lesser goldfinch

Flycatchers

TYRANNIDAE – TYRANT FLYCATCHERS

Sayornis nigricans – black phoebe

Sayornis saya – Say's phoebe

Tyrannus verticalis – western kingbird

Hawks

ACCIPITRIDAE – HAWKS, KITES, EAGLES, AND ALLIES

Buteo jamaicensis – red-tailed hawk

Hummingbirds

TROCHILIDAE – HUMMINGBIRDS

Calypte anna – Anna's hummingbird

Jays, Magpies and Crows

CORVIDAE – CROWS AND JAYS

Corvus corax – common raven

Larks

ALAUDIDAE – LARKS

Eremophila alpestris – horned lark

Mockingbirds and Thrashers

MIMIDAE – MOCKINGBIRDS AND THRASHERS

Mimus polyglottos – northern mockingbird

New World Vultures

CATHARTIDAE – NEW WORLD VULTURES

Cathartes aura – turkey vulture

Old World Sparrows

PASSERIDAE – OLD WORLD SPARROWS

* *Passer domesticus* – house sparrow

Pigeons and Doves

COLUMBIDAE – PIGEONS AND DOVES

Zenaida macroura – mourning dove

* *Streptopelia decaocto* – Eurasian collared-dove

Shrikes

LANIIDAE – SHRIKES

Lanius ludovicianus – loggerhead shrike

Starlings and Allies

STURNIDAE – STARLINGS

* *Sturnus vulgaris* – European starling

Swallows

HIRUNDINIDAE – SWALLOWS

Tachycineta thalassina – violet-green swallow

Terns and Gulls

LARIDAE – GULLS, TERNS, AND SKIMMERS

Larus californicus – California gull

Verdin

REMIZIDAE – PENDULINE TITS AND VERDINS

Auriparus flaviceps – verdin

New World Sparrows

PASSERELLIDAE – NEW WORLD SPARROWS

Zonotrichia leucophrys – white-crowned sparrow

Invertebrates

Butterflies

NYMPHALIDAE – BRUSH-FOOTED BUTTERFLIES

Vanessa cardui – painted lady

PIERIDAE – WHITES AND SULFURS

Colias eurytheme – orange sulphur

Pontia protodice – checkered white

Mammals

Canids

CANIDAE – WOLVES AND FOXES

Canis latrans – coyote

Vulpes macrotis arsipus – desert kit fox

Domestic

CANIDAE – WOLVES AND FOXES

* *Canis familiaris* – domestic dog

Hares and Rabbits

LEPORIDAE – HARES AND RABBITS

Lepus californicus – black-tailed jackrabbit

Sylvilagus audubonii – desert cottontail

Squirrels

SCIURIDAE – SQUIRRELS

Ammospermophilus leucurus – white-tailed antelope squirrel
Otospermophilus beecheyi – California ground squirrel
Xerospermophilus tereticaudus – round-tailed ground squirrel
Xerospermophilus tereticaudus × *Spermophilus mohavensis* – Round-tailed ground squirrel × Mohave ground squirrel hybrid

Rodents

HETEROMYIDAE – RODENTS

Chaetodipus spinatus sp. – Spiny pocket mouse
Dipodomys spp. – Kangaroo rat
Perognathus flavus sp. – Silky pocket mouse

Reptiles

Lizards

PHRYNOSOMATIDAE – IGUANID LIZARDS

Uta stansburiana – common side-blotched lizard

IGUANIDAE – IGUANAS

Dipsosaurus dorsalis – desert iguana

* signifies introduced (non-native) species

Appendix F

Special-Status Plants Potentially Occurring within the Biological Survey Area

Scientific Name	Common Name	Status (Federal/State/CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Potential to Occur
Abronia villosa var. *aurita*	chaparral sand-verbena	None/None/1B.1	Chaparral, Coastal scrub, Desert dunes; Sandy/annual herb/(Jan)Mar–Sep/ 245–5,245	**Not expected to occur.** Chaparral sand verbena was not observed during rare plant surveys. Minimal habitat for chaparral sand verbena occurs onsite. Most records of this species occur south of the San Gabriel and San Bernardino mountains (CCH 2023).
Astragalus jaegerianus	Lane Mountain milk-vetch	FE/None/1B.1	Joshua tree "woodland", Mojavean desert scrub; Granitic, Gravelly (sometimes), Sandy (sometimes)/perennial herb/ Apr–June/2,950–3,935	**Not expected to occur**. Lane mountain milk-vetch was not observed during rare plant surveys. While the study area contains suitable Mojavean Desert scrub, it is outside of the species' known elevation range.
Castela emoryi	Emory's crucifixion-thorn	None/None/2B.2	Mojavean desert scrub, Playas, Sonoran desert scrub; Gravelly/perennial deciduous shrub/(Apr)June–July (Sep–Oct)/295–2,375	**Not expected to occur.** Emory's crucifixion thorn was not observed during rare plant surveys. The study area is outside of the known geographic range of the species, with most records occurring southeast of the study area. The nearest mapped CNDDB record is approximately 12 miles east of the study area, near Dagett (CDFW 2023).
Cymopterus deserticola	desert cymopterus	None/None/1B.2	Joshua tree "woodland", Mojavean desert scrub; Sandy/perennial herb/Mar–May/2,065–4,920	**Not expected to occur**. Desert cymopterus was not observed during rare plant surveys. The nearest mapped CNDDB record is approximately 9 miles north of the study area (CDFW 2023).
Diplacus mohavensis	Mojave monkeyflower	None/None/1B.2	Joshua tree "woodland", Mojavean desert scrub; Gravelly (sometimes), Sandy (sometimes), Washes (often)/annual herb/Apr–June/ 1,965–3,935	**Not expected to occur.** Mojave monkeyflower was not observed during rare plant surveys. The study area does not contain suitable habitat for Mojave monkey flower as the site is too disturbed. A rare plant reference check was performed on March 20, 2023 and the

Scientific Name	Common Name	Status (Federal/State/CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Potential to Occur
				annual herb was observed in flower and with some flowers drying out. The nearest mapped CNDDB record is approximately 2 miles north of the study area, and there are several other records of the species less than 5 miles away (CDFW 2023).
Eriophyllum mohavense	Barstow woolly sunflower	None/None/1B.2	Chenopod scrub, Mojavean desert scrub, Playas/annual herb/Mar–May/ 1,640–3,145	**Not expected to occur.** Barstow woolly sunflower was not observed during rare plant surveys. The nearest mapped CNDDB record is approximately 2.5 miles southeast of the study area, and there are 2 other records less than 5 miles away (CDFW 2023).
Menodora spinescens var. *mohavensis*	Mojave menodora	None/None/1B.2	Mojavean desert scrub; Gravelly, Rocky, Slopes/perennial deciduous shrub/ Apr–May/2,260–6,560	**Not expected to occur**. Mojave menodora was not observed during rare plant surveys. A rare plant reference check was performed on May 20, 2023. Mojave menodora is a large shrub. Mojave menodora was blooming during the reference check. The nearest mapped CNDDB record is approximately 6 miles southeast of the study area (CDFW 2023).
Mentzelia tricuspis	spiny-hair blazing star	None/None/2B.1	Mojavean desert scrub; Gravelly, Sandy, Slopes, Washes/annual herb/ Mar–May/490–4,195	**Not expected to occur**. Spiny-hair blazing star was not observed during rare plant surveys. The nearest mapped CNDDB record is approximately 4 miles east of the study area, however it is a historical record (CDFW 2023).
Mentzelia tridentata	creamy blazing star	None/None/1B.3	Mojavean desert scrub; Gravelly, Rocky, Sandy/annual herb/Mar–May/ 2,295–3,850	**Not expected to occur**. Creamy blazing star was not observed during rare plant surveys. The study area is within the known elevation range of the species and contains suitable Mojavean desert scrub vegetation. Additionally, soils within the

Scientific Name	Common Name	Status (Federal/State/CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Potential to Occur
				study area are generally sandy (USDA 2023). The nearest mapped CNDDB record is approximately 4 miles east of the study area, however it is a historical record. Other records of the species generally occur 7-10 miles east of the study area (CDFW 2023).
Pediomelum castoreum	Beaver Dam breadroot	None/None/1B.2	Joshua tree "woodland", Mojavean desert scrub; Roadsides, Sandy, Washes/perennial herb/ Apr–May/2,000–5,000	**Not expected to occur**. Beaver Dam breadroot was not observed during rare plant surveys. A rare plant reference check was performed on May 20, 2023 and the plant was observed fruiting. The nearest mapped CNDDB record is approximately 0.5 miles south of the study area, however this record and all other in the vicinity of the study area are historical (CDFW 2023).
Phacelia parishii	Parish's phacelia	None/None/1B.1	Mojavean desert scrub, Playas; Alkaline (sometimes), Clay (sometimes)/annual herb/Apr–May (June–July)/1,770–3,935	**Low potential to occur**. Parish's phacelia was not observed during rare plant surveys but would likely have been dried out onsite. *Amsinkia* species were abundant and dried out throughout the site and have a helicoid cyme similar to *Phacelia*. The study area lacks clay soils, and the study area only contains a few areas of slightly alkaline soil (USDA 2023; Calflora 2023). Additionally, there are no extant CNDDB records of the species within the 9 7.5-minute USGS quadrangles containing the study area (CDFW 2023).
Puccinellia simplex	California alkali grass	None/None/1B.2	Chenopod scrub, Meadows and seeps, Valley and foothill grassland, Vernal pools; Alkaline, Flats, Lake Margins, Vernally Mesic/annual herb/ Mar–May/5–3,050	**Not expected to occur**. California alkali grass was not observed during rare plant surveys. The site lacks vernal pools or alkaline flats. The nearest mapped CNDDB record is approximately 10 miles north of the study area (CDFW 2023).

Known to occur: the species has been documented on the project site by a reliable source.
High potential to occur: the species has not been documented on the project site but is known to recently occur in the vicinity and suitable habitat is present.
Moderate potential to occur: the species has not been documented on the project site or in the vicinity, but the site is within the known range of the species and suitable habitat for the species is present.
Low potential to occur: the species has not been documented on the project site or in the vicinity, but the site is within the known range of the species; however, suitable habitat for the species onsite is of low quality.
Not expected to occur: the project site is outside the known geographic or elevational range of the species and/or the site does not contain suitable habitat for the species.

Status Legend:
FE: Federally listed as endangered
FT: Federally listed as threatened
FC: Federal Candidate for listing
DL: Delisted
SE: State listed as endangered
ST: State listed as threatened
SC: State Candidate for listing
SR: State Rare
CRPR 1A: Plants presumed extirpated in California and either rare or extinct elsewhere
CRPR 1B: Plants rare, threatened, or endangered in California and elsewhere
CRPR 2A: Plants presumed extirpated in California but common elsewhere
CRPR 2B: Plants rare, threatened, or endangered in California but more common elsewhere
CRPR 3: Review List: Plants about which more information is needed
CRPR 4: Watch List: Plants of limited distribution
.1 Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
.2 Moderately threatened in California (20–80% occurrences threatened / moderate degree and immediacy of threat)
.3 Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current threats known)
CBR: Considered but Rejected

Appendix G

Special-Status Wildlife Potentially Occurring within the Biological Survey Area

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur[1]
Amphibians				
Anaxyrus californicus	arroyo toad	FE/SSC	Semi-arid areas near washes, sandy riverbanks, riparian areas, palm oasis, Joshua tree, mixed chaparral and sagebrush; stream channels for breeding (typically third order); adjacent stream terraces and uplands for foraging and wintering	**Not expected to occur**. The study area lacks washes/stream channels, riparian areas, palm oasis, Joshua tree, mixed chaparral or sagebrush habitat.
Birds				
Aquila chrysaetos (nesting and wintering)	golden eagle	None/FP, WL	Nests and winters in hilly, open/semi-open areas, including shrublands, grasslands, pastures, riparian areas, mountainous canyon land, open desert rimrock terrain; nests in large trees and on cliffs in open areas and forages in open habitats	**Not expected to occur**. While the study area contains open shrubland habitat that may be suitable for foraging habitat, it lacks trees or cliffs necessary for nesting.
Athene cunicularia (burrow sites and some wintering sites)	burrowing owl	BCC/SCE	Nests and forages in grassland, open scrub, and agriculture, particularly with ground squirrel burrows	**High potential to occur**. The study area contains open scrub habitat, with some small mammal burrows. The nearest mapped CNDDB record is approximately 1 mile southeast of the study area (CDFW 2023).
Charadrius montanus (wintering)	mountain plover	BCC/SSC	Winters in shortgrass prairies, plowed fields, open sagebrush, and sandy deserts	**Low potential to occur**. The study area lacks shortgrass prairies, plowed fields, or open sagebrush habitat. While it contains sandy desert areas, the only CNDDB record of the species in the 7.5-minute quadrangles containing the study area is mapped approximately 11 miles northwest of the study area (CDFW 2023).
Coccyzus americanus occidentalis (nesting)	western yellow-billed cuckoo	FT/SE	Nests in dense, wide riparian woodlands and forest with well-developed understories	**Not expected to occur**. The study area lacks riparian woodland or forest habitat necessary to support this species.

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur[1]
Lanius ludovicianus (nesting)	loggerhead shrike	None/SSC	Nests and forages in open habitats with scattered shrubs, trees, or other perches	**Known to occur**. A logger head shrike was observed on site by Dudek biologists on January 23, 2023, during the biological reconnaissance survey.
Toxostoma lecontei	LeConte's thrasher	BCC/SSC	Nests and forages in desert wash, desert scrub, alkali desert scrub, desert succulent, and Joshua tree habitats; nests in spiny shrubs or cactus	**Moderate potential to occur**. The study area contains desert scrub, with spiny shrub species such as *Lycium* and *Atriplex* that may provide suitable nesting habitat. The nearest mapped CNDDB record is approximately 4 miles east of the study area in Barstow proper (CDFW 2023). While this is a historical record, there are a few current sightings of the species less than 5 miles from the study area (eBird 2023).
Fishes				
Siphateles bicolor mohavensis	Mohave tui chub	FE/FP, SE	Lacustrine ponds or pools; 4 feet min water depth; freshwater flow; mineralized and alkaline environment; habitat for aquatic invertebrate prey and egg attachment substrate; Ruppia maritima preferred for egg attachment and thermal refuge in summer months	**Not expected to occur**. The study area lacks surface water features.
Invertebrates				
Danaus plexippus plexippus pop. 1	monarch - California overwintering population	FC/None	Wind-protected tree groves with nectar sources and nearby water sources	**Not expected to occur**. The study area lacks wind-protected tree groves and nearby water sources. Additionally, this species generally overwinters in proximity to the ocean, where winter temperatures are milder.

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur[1]
Mammals				
Corynorhinus townsendii	Townsend's big-eared bat	None/SSC	Mesic habitats characterized by coniferous and deciduous forests and riparian habitat, but also xeric areas; roosts in limestone caves and lava tubes, human-made structures, and tunnels	**Not expected to occur.** While the study area contains xeric desert scrub habitat, it lacks limestone caves, lava tubes, human-made structures, or tunnels for roosting. The nearest mapped CNDDB record is approximately 14 miles northeast of the study area in the Calico mountains (CDFW 2023).
Spermophilus (Xerospermophilus) mohavensis	Mohave ground squirrel	None/ST	Desert scrub habitats including those dominated by creosote bush and burrobrush, desert sink scrub, and desert saltbush scrub	**Potentially Present**. Focused trapping surveys were conducted in the northern and southern portions of the site. Round-tailed ground squirrels (*Xerospermophilus tereticaudus*) exhibiting some Mohave ground squirrel characteristics were detected. CDFW stated they would consider these hybrids as a positive presence for Mohave ground squirrel. The study area contains desert scrub with creosote bush, as well as saltbush scrub. Additionally, Mohave ground squirrel is known to prefer sandy to gravelly soils, which are present within the review area (Johnson et al. 2019; USDA 2023). Some small mammal burrows were observed within the study area, though many appeared to be inactive. The nearest mapped CNDDB record is approximately 1 mile north of the study area. Additionally, there are several other records of the species within 5 miles of the study area (CDFW 2023).

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur[1]
Taxidea taxus	American badger	None/SSC	Dry, open, treeless areas; grasslands, coastal scrub, agriculture, and pastures, especially with friable soils	**Low potential to occur**. While the study area is dry and open, with friable soils, it lacks grasslands, coastal scrub, agriculture, or pasture habitat. The only CNDDB record within the nine 7.5-minute USGS quadrangles containing the study area is approximately 7.5 miles northwest of the study area near Old Bakersfield Highway (CDFW 2023).
Vulpes macrotis arsipus	desert kit fox	None/None[1]	Sparse vegetated scrub habitats such as creosote scrub communities that support abundant rodent populations (Center for Biological Diversity 2013)	**High potential to occur**. An active desert kit fox burrow complex and tracks were incidentally observed on site by a Dudek biologist during desert tortoise surveys.
Reptiles				
Gopherus agassizii	Mojave desert tortoise	FT/ST	Arid and semi-arid habitats in Mojave and Sonoran Deserts, including sandy or gravelly locations along riverbanks, washes, sandy dunes, canyon bottoms, desert oases, rocky hillsides, creosote flats, and hillsides	**Low potential to occur**. While the study area contains creosote flats, some sandy dunes, and sandy hillsides that could provide suitable habitat to this species, no desert tortoise or their sign were observed during focused surveys in January 2023. The southwestern end of the study area overlaps with a CNDDB delineated area containing what was historically the largest of four primary populations in California (CDFW 2023).
Uma scoparia	Mohave fringe-toed lizard	None/SSC	Loose wind-blown sand dunes, flats with sandy hummocks, washes, and banks of rivers	**High potential to occur**. The study area contains areas of loose wind-blown dunes, and flats with sandy hummocks. Additionally, the study area contains shrubs and annual plants which may support arthropods, a part of the Mohave fringe-toed lizard diet. The nearest mapped CNDDB record is approximately 1

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur[1]
				mile southwest of the study area (CDFW 2023).

Notes: CNDDB = California Natural Diversity Database; USGS = U.S. Geological Survey.

[1] Definitions for potential to occur:

Present: the species has been documented on the project site by a reliable source.

High potential to occur: the species has not been documented on the project site but is known to recently occur in the vicinity and suitable habitat is present.

Moderate potential to occur: the species has not been documented on the project site or in the vicinity, but the site is within the known range of the species and suitable habitat for the species is present.

Low potential to occur: the species has not been documented on the project site or in the vicinity, but the site is within the known range of the species; however, suitable habitat for the species on site is of low quality.

Not expected to occur: the project site is outside the known geographic or elevational range of the species and/or the site does not contain suitable habitat for the species.

DUDEK
605 Third Street
Encinitas, California 92024
Loukas Barton, PhD, RPA; Adam Giacinto, MA, RPA; Roshanne Bakhtiary MA; Jessica Colston, BA; Micah Hale, PhD, RPA

This report was prepared by Dudek Archaeologists Roshanne Bakhtiary, MA; Adam Giacinto, MA, RPA; Jessica Colston, BA; Loukas Barton, PhD, RPA; and Micah Hale, PhD, RPA. All fieldwork, reporting, and development of management recommendations were completed by specialists meeting the Secretary of the Interior's professional qualifications standards for archaeology. This report is intended for the exclusive use of the Client and its representatives. It contains professional conclusions and recommendations concerning the potential for project-related impacts to cultural resources based on the results of Dudek's investigation. It should not be considered to constitute project clearance with regard to the treatment of cultural resources or permission to proceed with the project described in lieu of review by the appropriate reviewing or permitting agency. This report should be submitted to the appropriate state and local review agencies for their comments prior to the commencement of the project.

INTENTIONALLY LEFT BLANK

Management Summary

Dudek conducted a cultural resources inventory study for the proposed Electric Vehicle (EV) Charging Station and Logistics Facility (Project) in the census-designated place (CDP) of Lenwood, San Bernardino County, California. The Project area is located on Lenwood Road between California Highway 58 (SR 58) and Interstate 15 (I-15), and falls within Section 8 of Township 9 North, and Range 2 West of the Barstow, California United States Geological Survey (USGS) 7.5-minute Quadrangle (Figure 1, Project Location). The Project proponent proposes to develop the approximately 100-acre Project area into (1) an EV charging station to serve light duty/passenger vehicles and medium and heavy-duty trucks, and (2) a state-of-the-art concrete tilt-up logistics facility of 1,341,432 square feet in three buildings. The Project area encompasses Assessor Parcel Numbers (APNs) 0497-142-03, 0497-142-04, 0497-142-14, and 0497-142-15 (Figure 2, Project Area).

This study was completed under the provisions of local regulations as well as the California Environmental Quality Act (CEQA). Public Resources Code (PRC) Section 5024.1, Title 14 California Code of Regulations (CCR) Section 15064.5 of the CEQA Guidelines, and PRC Sections 21083.2 and 21084.1 were also used as basic guidelines for this cultural resource study (Governor's Office of Planning and Research 1998). PRC Section 5024.1 requires the identification and evaluation of cultural resources to determine their eligibility for listing in the California Register of Historical Resources (CRHR). San Bernardino County has been identified as the lead agency for this Project and is responsible for compliance with CEQA and local regulations.

Dudek conducted a records search of the proposed Project area and the surrounding one-mile radius at the South Central Coastal Information Center (SCCIC). The records search identified two previously recorded cultural resources that intersect the Project area, and another 47 previously recorded cultural resources within a one-mile radius of the Project area. The two previously recorded cultural resources that intersect the Project area include two prehistoric lithic quarries/lithic scatters (P-36-003677 and P-36-005076). A search of the Native American Heritage Commission's (NAHC) Sacred Lands File (SLF) did not identify any previously recorded Native American cultural resources within the Project area or a one-mile radius of the Project area. A review of historic topographic maps and aerial imagery indicate that the Project area has remained undeveloped since at least 1952. There is evidence from the historic aerial imagery to indicate that the Project area has been used in the past for off-road travel, rockhounding, and other recreational activities.

Dudek conducted a cultural resources pedestrian survey of the Project area on April 14 and July 6, 2023. The survey crew successfully relocated both previously recorded cultural resources (P-36-003677 and P-36-005076) within the Project area. Additionally, seven newly identified cultural resources were recorded within the Project area during this pedestrian survey. These newly identified cultural resources include a prehistoric lithic scatter (LE-S-001), three prehistoric lithic isolates (LE-I-002, LE-I-004, and LE-I-005), and three historic-era isolates (LE-I-001, LE-I-003, and LE-I-006). Isolates are categorically ineligible for listing on the CRHR and not considered to be to be significant under CEQA. Both previously recorded cultural resources and LE-S-001 required formal evaluation for eligibility for listing on the CRHR and for significance under CEQA and local regulations prior to Project implementation. P-36,003677, P-36-005076, and LE-S-001 were formally evaluated as part of this effort and are recommended to not be eligible for listing on the CRHR and are not significant under CEQA and local regulations.

Pursuant to the requirements outlined by San Bernardino County following input from Consulting Tribes, Dudek conducted limited-scope sub-surface testing on March 4, 2025, for buried cultural resources within the proposed Project site but beyond the boundaries of known cultural resources. On July 22 and July 24, 2025, Dudek was on

site to observe stratigraphy exposed during geotechnical fault-slip trenching. Both efforts were designed to evaluate potential for buried cultural resources. No significant cultural resources were identified during either effort and no subsurface stratigraphy with high potential for buried cultural resources were identified.

New California Department of Parks and Recreation (DPR) 523 forms were prepared for the seven newly identified resources, and DPR 523 form updates were prepared for the two previously recorded and relocated resources. All DPR 523 forms will be submitted to the SCCIC of the California Historical Resources Information System (CHRIS) at California State University, Fullerton.

Dudek recommends archaeological monitoring around known archaeological sites during ground disturbing activities for the Project. The requirement for Native American monitoring should be determined by the lead agency, through the process of consultation pursuant to Assembly Bill 52.

1 Introduction

1.1 Project Location and Description

The proposed Project is located on Lenwood Road between SR 58 and I-15, in the census-designated place of Lenwood, San Bernardino County, California. The Project falls within Section 8 of Township 9 North, and Range 2 West of the Barstow, California USGS 7.5-minute Quadrangle (Figure 1, Project Location) and encompasses 0497-142-03, 0497-142-04, 0497-142-14, and 0497-142-15 (Figure 2, Project Area).

The Project proponent proposes to develop the approximately 100-acre Project area into (1) an EV charging station to serve light duty/passenger vehicles and medium and heavy-duty trucks, and (2) a state-of-the-art concrete tilt-up logistics facility of 1,341,432 square feet in three buildings.

The proposed Project would also contain associated site improvements, including landscaping, parking, required utility facilities and upgrades, a drainage basin, and a buffer (e.g., landscaping, wall) at the project's southern boundary. Access to and from the Project area would be via Lenwood Road.

EV Charging Station

The proposed approximately 21-acre EV charging station would provide EV charging for light duty/passenger vehicles and medium and heavy-duty trucks.

The proposed EV charging station would provide a range of EV chargers to serve different charging needs (e.g., automobiles vs medium and heavy-duty trucks; slower chargers for overnight truck charging vs: MCS charging for trucks, etc.).

The EV charging station would also include a commercial building of up to 15,000 square feet that would contain ancillary uses (e.g., food, convenience services, showers for travelers, other amenities, etc.) for those utilizing the hub, as well as for local residents and nearby light industrial uses.

Logistics Facility

The remainder of the site, approximately 80-acres, would include a proposed logistics facility to meet the demand for highly functional, efficient logistics buildings that meet contemporary industry standards. The facility would consist of three buildings, each comprising 447,144 square feet, with a total square footage of 1,341,432.

1.2 Regulatory Context

This Project is subject to state and local regulations regarding cultural resources. The following section provides a summary of the applicable regulations, policies, and guidelines relating to the proper management of cultural resources for this Project.

State Level Regulations

1.2.1 The California Register of Historic Resources (California Public Resources Code Section 5020 ET SEQ.)

In California, the term "historical resource" includes but is not limited to "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (California PRC section 5020.1(j)). In 1992, the California legislature established CRHR "to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (California PRC section 5024.1(a)). A resource is eligible for listing in the CRHR if the State Historical Resources Commission determines that it is a significant resource and that it meets any of the following National Register of Historic Places (NRHP) criteria:

- Associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
- Associated with the lives of persons important in our past.
- Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
- Has yielded, or may be likely to yield, information important in prehistory or history.

(California PRC section 5024.1(c).) Resources less than 50 years old are not considered for listing in the CRHR but may be considered if it can be demonstrated that sufficient time has passed to understand the historical importance of the resource (see 14 CCR, section 4852(d)(2)).

The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historic resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed or formally designated as eligible for listing on the NRHP are automatically listed on the CRHR, as are the state landmarks and points of interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys. The State Historic Preservation Officer maintains the CRHR.

1.2.2 Native American Historic Cultural Sites (California Public Resources Code Section 5097 et seq.)

State law addresses the disposition of Native American burials in archaeological sites and protects such remains from disturbance, vandalism, or inadvertent destruction; establishes procedures to be implemented if Native American skeletal remains are discovered during construction of a project; and establishes the NRHC to resolve disputes regarding the disposition of such remains. In addition, the Native American Historic Resource

Protection Act makes it a misdemeanor punishable by up to 1 year in jail to deface or destroy an Indian historic or cultural site that is listed or may be eligible for listing in the CRHR.

1.2.3 California Native American Graves Protection and Repatriation Act

The California Native American Graves Protection and Repatriation Act (California Repatriation Act), enacted in 2001, required all state agencies and museums that receive state funding and that have possession or control over collections of human remains or cultural items, as defined, to complete an inventory and summary of these remains and items on or before January 1, 2003, with certain exceptions. The California Repatriation Act also provides a process for the identification and repatriation of these items to the appropriate tribes. New collections generated and transferred to a repository, such as a collection that would be generated as a result of archaeological fieldwork conducted within the project area prior to or during project implementation, may ultimately be subject to the California Native American Graves Protection and Repatriation Act of 2001 (i.e., "CalNAGPRA").

1.2.4 California Environmental Quality Act

As described further below, the following CEQA statutes and CEQA Guidelines are of relevance to the analysis of archaeological and historic resources:

1. California PRC section 21083.2(g): Defines "unique archaeological resource."
2. California PRC section 21084.1 and CEQA Guidelines section 15064.5(a): Define historical resources. In addition, CEQA Guidelines section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource;" it also defines the circumstances when a project would materially impair the significance of a historical resource.
3. California PRC section 5097.98 and CEQA Guidelines section 15064.5(e): Set forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated cemetery.
4. California PRC sections 21083.2(b)-(c) and CEQA Guidelines section 15126.4: Provide information regarding the mitigation framework for archaeological and historic resources, including options of preservation-in-place mitigation measures; preservation-in-place is the preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context, and may also help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

Under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (California PRC section 21084.1; CEQA Guidelines section 15064.5(b)). If a site is either listed or eligible for listing in the CRHR, or if it is included in a local register of historic resources or identified as significant in a historical resources survey (meeting the requirements of California PRC section 5024.1(q)), it is a "historical resource" and is presumed to be historically or culturally significant for purposes of CEQA (California PRC section 21084.1; CEQA Guidelines section 15064.5(a)). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (California PRC section 21084.1; CEQA Guidelines section 15064.5(a)).

A "substantial adverse change in the significance of an historical resource" reflecting a significant effect under CEQA means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (CEQA Guidelines section 15064.5(b)(1); California PRC section 5020.1(q)). In turn, the significance of a historical resource is materially impaired when a project:

1. Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or
2. Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
3. Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a lead agency for purposes of CEQA.

1.2.5 California Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98

CEQA Guidelines section 15064.5 assigns special importance to human remains and specifies procedures to be used when Native American remains are discovered. As described below, these procedures are detailed in California Health and Safety Code section 7050.5 and PRC section 5097.98.

California law protects Native American burials, skeletal remains, and associated grave goods, regardless of their antiquity, and provides for the sensitive treatment and disposition of those remains. Health and Safety Code section 7050.5 requires that if human remains are discovered in any place other than a dedicated cemetery, no further disturbance or excavation of the site or nearby area reasonably suspected to contain human remains shall occur until the County coroner has examined the remains (California Health and Safety Code section 7050.5[b]). If the coroner determines or has reason to believe the remains are those of a Native American, the coroner must contact the NAHC within 24 hours (California Health and Safety Code section 7050.5[c]). In accordance with California PRC section 5097.98(a), the NAHC will notify the Most Likely Descendant (MLD). With the permission of the landowner, the MLD may inspect the site of discovery. Within 48 hours of being granted access to the site, the MLD may recommend means of treatment or disposition, with appropriate dignity, of the human remains and associated grave goods.

1.2.6 Assembly Bill 52

California Assembly Bill 52 (AB 52), which took effect July 1, 2015, establishes a consultation process between California Native American Tribes and lead agencies to address tribal concerns regarding project impacts and mitigation to "tribal cultural resources" (TCR). PRC section 21074(a) defines TCRs and states that a project that has the potential to cause a substantial adverse change to a TCR is a project that may have an adverse effect on the environment. A TCR is defined as a site, feature, place, cultural landscape, sacred place, and object with cultural value to a California Native American tribe that is either:

1. listed or eligible for listing in the CRHR or a local register of historical resources, or
2. determined by a lead agency to be a TCR.

1.2.7 Guidelines for Determining Significance

According to the CEQA Guidelines (section 15064.5b), a project with an effect that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment. CEQA defines a substantial adverse change:

> Substantial adverse change in the significance of an historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired.

The significance of an historical resource is materially impaired when a project:

- Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for inclusion in, the CRHR; or
- Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
- Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its eligibility for inclusion in the CRHR as determined by a lead agency for purposes of CEQA.

Section 15064.5(c) of the CEQA Guidelines applies to effects on archaeological sites and contains the following additional provisions regarding archaeological sites:

- When a project will impact an archaeological site, a lead agency shall first determine whether the site is an historical resource, as defined in subsection (a).
- If a lead agency determines that the archaeological site is a historical resource, it shall refer to the provisions of section 21084.1 of the Public Resources Code, and this section, section 15126.4 of the Guidelines, and the limits contained in section 21083.2 of the Public Resources Code do not apply.
- If an archaeological site does not meet the criteria defined in subsection (a), but does meet the definition of a unique archaeological resource in section 21083.2 of the Public Resources Code, the site shall be treated in accordance with the provisions of section 21083.2. The time and cost limitations described in Public Resources Code section 21083.2 (c–f) do not apply to surveys and site evaluation activities intended to determine whether the project location contains unique archaeological resources.
- If an archaeological resource is neither a unique archaeological nor a historical resource, the effects of the project on those resources shall not be considered a significant effect on the environment. It shall be sufficient that both the resource and the effect on it are noted in the Initial Study or Environmental Impact Report (EIR), if one is prepared to address impacts on other resources, but they need not be considered further in the CEQA process.

CEQA Guidelines section 15064.5 (d) and (e) contain additional provisions regarding human remains. Regarding Native American human remains, paragraph (d) provides:

> When an initial study identifies the existence of, or the probable likelihood of, Native American human remains within the project, a lead agency shall work with the appropriate Native Americans as identified by the Native American Heritage Commission as provided in PRC section 5097.98. The applicant may develop an agreement for treating or disposing of, with appropriate dignity, the human remains and any items associated with Native American burials with the appropriate Native Americans as identified by the Native American Heritage Commission. Action implementing such an agreement is exempt from:
>
> 1. The general prohibition on disinterring, disturbing, or removing human remains from any location other than a dedicated cemetery (Health and Safety Code Section 7050.5); and
> 2. The requirement of CEQA and the Coastal Act.

Under CEQA, an EIR is required to evaluate any impacts on unique archaeological resources (PRC section 21083.2). A "unique archaeological resource" is defined as (PRC section 21083.2(g)):

[A]n archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

An impact to a non-unique archaeological resource is not considered a significant environmental impact and such non-unique resources need not be further addressed in the EIR (PRC section 21083.2(a); CEQA Guidelines section 15064.5(c)(4)).

As stated above, CEQA contains rules for mitigation of "unique archeological resources." For example (PRC section 21083.2(b)(1)-(4)), "[i]f it can be demonstrated that a project will cause damage to a unique archeological resource, the lead agency may require reasonable efforts to be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. Examples of that treatment, in no order of preference, may include, but are not limited to, any of the following:"

1. "Planning construction to avoid archeological sites."
2. "Deeding archeological sites into permanent conservation easements."
3. "Capping or covering archeological sites with a layer of soil before building on the sites."
4. "Planning parks, greenspace, or other open space to incorporate archeological sites."

PRC section 21083.2(d) states that "[e]xcavation as mitigation shall be restricted to those parts of the unique archeological resource that would be damaged or destroyed by the project. Excavation as mitigation shall not be required for a unique archeological resource if the lead agency determines that testing or studies already completed have adequately recovered the scientifically consequential information from and about the resource, if this determination is documented in the environmental impact report."

The rules for mitigating impacts to archeological resources to qualify as "historic resources" are slightly different. According to CEQA Guidelines section 15126.4(b), "[p]ublic agencies should, whenever feasible, seek to avoid damaging effects on any historic resource of an archeological nature. The following factors shall be considered and discussed in an EIR for a project involving such an archeological site:

A. Preservation in place is the preferred manner of mitigating impacts to archeological sites. Preservation in place maintains the relationship between artifacts and the archeological context. Preservation may also avoid conflict with religious or cultural values of groups associated with the site.
B. Preservation in place may be accomplished by, but is not limited to, the following:
    1. Planning construction to avoid archeological sites;
    2. Incorporation of sites within parks, greenspace, or other open space;
    3. Covering the archeological sites with a layer of chemically stable soil before building tennis courts, parking lots, or similar facilities on the site [; and]
    4. Deeding the site into a permanent conservation easement.

Thus, although PRC section 21083.2, in addressing "unique archeological sites," provides for specific mitigation options "in no order of preference," CEQA Guidelines section 15126.4(b), in addressing "historical resources of an archeological nature," provides that "[p]reservation in place is the preferred manner of mitigating impacts to archeological sites."

Under CEQA, "[w]hen data recovery through excavation is the only feasible mitigation," the lead agency may cause to be prepared and adopt a "data recovery plan," prior to any excavation being undertaken. The data recovery plan must make "provision for adequately recovering the scientifically consequential information from and about the historic resource" (CEQA Guidelines section 15126.4(b)(3)(C)). The data recovery plan also "must be deposited with the California Historical Resources Regional Information Center" (CEQA Guidelines section 15126.4(b)(3)(C)). Further, "[i]f an artifact must be removed during project excavation or testing, curation may be an appropriate mitigation" (CEQA Guidelines section 15126.4(b)(3)(C)).

However, "[d]ata recovery shall not be required for an historical resource if the lead agency determines that testing or studies already completed have adequately recovered the scientifically consequential information from and about the archeological or historic resource, provided that determination is documented in the EIR and that the studies are deposited with the California Historical Resources Regional Information Center" (CEQA Guidelines section 15126.4(b)(3)(D)).

Local Level Regulations

1.2.8 San Bernardino County Countywide Plan

San Bernardino County's Countywide Plan, adopted in 2011, contains a Cultural Resources Element that establishes the County's purpose, principles, goals, and policies for the management of archaeological sites, sacred landscapes, historic buildings, and paleontological resources located in the unincorporated portions of the County. An outline of the County's Cultural Resources Element is provided below (San Bernardino County 2020).

Purpose

- Establish Direction on notification, coordination, and partnerships to preserve and conserve cultural resources.
- Provide guidance on how new development can avoid or minimize impacts on cultural resources.
- Provide direction on increasing public awareness and education efforts about cultural resources.

Principles

We believe:

- Today's generation are stewards of the county's cultural history and are responsible for conserving it for future generations.
- Preserving and celebrating cultural resources enhances our understanding of the world in which we live.
- Cultural resources are valuable assets that attract visitors and support local businesses.

Goal CR-1. Tribal Cultural Resources. Tribal cultural resources that are preserved and celebrated out of respect for Native American beliefs and traditions.

Policy CR-1.1. Tribal Notification and Coordination. We notify and coordinate with tribal representatives in accordance with state and federal laws to strengthen our working relationship with area tribes, avoid inadvertent discoveries of Native American archaeological sites and burials, assist with the treatment and disposition of inadvertent discoveries, and explore options of avoidance of cultural resources early in the planning process.

Policy CR-1.2. Tribal Planning. We will collaborate with local tribes on countywide planning efforts and, as permitted or required, planning efforts initiated by local tribes.

Policy CR-1.3. Mitigation and Avoidance. We consult with local tribes to establish appropriate project-specific mitigation measures and resource-specific treatment of potential cultural resources. We require project applicants to design projects to avoid known tribal cultural resources, whenever possible. If avoidance is not possible, we require appropriate mitigation to minimize project impacts on tribal cultural resources.

Policy CR-1.4. Resource Monitoring. We encourage active participation by local tribes as monitors in surveys, testing, excavation, and grading phases of development projects with potential impacts on tribal resources.

Goal CR-2. Historic and Paleontological Resources. Historic resources (buildings, structures, or archaeological resources) and paleontological resources that are protected and preserved for their cultural importance to local communities as well as their research and educational potential.

Policy CR-2.1. National and State Historic Resources. We encourage the preservation of archaeological sites and structures of state or national significance in accordance with the Secretary of Interior's standards.

Policy CR-2.2. Local Historic Resources. We encourage property owners to maintain the historic integrity of resources on their property by (listed in order of preference): preservation, adaptive reuse, or memorialization.

Policy CR-2.3. Paleontological and Archaeological Resources. We strive to protect paleontological and archaeological resources from loss or destruction by requiring that new development include appropriate mitigation to preserve the quality and integrity of these resources. We require new development to avoid paleontological and archeological resources whenever possible. If avoidance is not possible, we require the salvage and preservation of paleontological and archeological resources.

Policy CR-2.4. Partnerships. We encourage partnerships to champion and financially support the preservation and restoration of historic sites, structures, and districts.

Policy CR-2.5. Public Awareness and Education. We increase public awareness and conduct education efforts about the unique historic, natural, tribal, and cultural resources in San Bernardino County through the County Museum and in collaboration with other entities.

1.3 Native American Coordination

Dudek requested an NAHC search of the SLF on January 24, 2023, for the proposed Project area and surrounding one-mile radius. The SLF consists of a database of known Native American resources. These resources may not be included in the SCCIC database. The NAHC results, received February 14, 2023, reported that no Native American cultural resources were reported to be on file with the NAHC for this search area. The NAHC additionally provided a list of Native American tribes and individuals/organizations with traditional geographic associations that might have knowledge of cultural resources in this area. To date, Dudek has not sent outreach letters to any of the entities identified by the NAHC. See Appendix D for complete documentation of NAHC correspondence and SLF results.

CEQA (as amended, 2014) requires lead agencies to provide notification of projects and an invitation to consult to Native American tribes who have requested to be notified of projects within their jurisdiction. As such, San Bernardino County will provide project notifications and engage in government-to-government consultation with Native American tribes who respond to the project notice within 30 days of receipt and elect to consult. It is recommended that early engagement is conducted with these tribes to ensure they have an opportunity to provide input with regard to TCRs and/or other resources of Native American origin and value. While this report does not identify or address TCRs, it may be useful during consultation and should be provided to consulting tribes for review and comment upon request.

1.4 Report Format and Key Personnel

Following this introduction, Chapter 2 presents the environmental and historical background of the Project area, and Chapter 3 presents the research design for the archaeological site evaluations. Chapter 4 outlines the methods used to conduct this study, and Chapters 5 and 6 present the results of the records search, field survey, subsurface observations, and evaluations. Chapter 7 summarizes the results of the study, discusses interpretation and the evaluation of the archaeological resources, and provides recommendations for treatment. Four appendices are included that contain additional information: Confidential Appendix A includes SCCIC records search information,

Confidential Appendix B contains a resource location map, Confidential Appendix C includes California Department of Parks and Recreation (DPR) 523 forms, and Appendix D includes Native American correspondence documents.

Dudek Archaeological Principal Investigator Adam Giacinto, M.A., RPA managed the Project and co-authored this report with Dudek archaeologist Roshanne Bakhtiary M.A. and Dudek archaeologist Jessica Colston, B.A. Dudek archaeologist Loukas Barton, PhD, RPA contributed to Chapters 2, 3, 6, and 7, and Dudek archaeologist Micah Hale, PhD, RPA contributed to Chapter 3. Dudek archaeologist Loukas Barton also served as field director for the cultural resources field efforts, and was the primary author of this revised report. Archaeologists Jessica Colston, David Faith, Scott Wolf, and Patrick Hadel acted as field crew staff.

INTENTIONALLY LEFT BLANK

2 Setting

The following description of environmental and cultural contexts is not intended to be exhaustive, but to provide context for understanding human occupation and use of the Central and Western Mojave Desert. It draws on decades of work from the authors of this report, from Lechner and Giambastiani (2008), and several others (Basgall 1993, 2000, 2008; Basgall and Hall 1991, 1994; Giambastiani and Basgall 2008; Giambastiani et al. 2008, 2013; Hale et al. 2020, 2023). Some portions of this setting are cited from Keegan and Becker (2021).

2.1 Natural Setting

The northern boundary of the Project area is approximately 700 meters (m) south and the western boundary is approximately 2,300 m east of the current channel of the Mojave River, and due west of downtown Barstow. The Mojave River flows through a channel between the Mitchell Range to the north, and the Daggett Ridge to the south. The Project area is at the northwestern terminus of the geological features that both abut and are transformed by the Daggett Ridge uplift. Here, relatively subtle outcrops of eroding volcanic, metavolcanic, and sedimentary strata interweave with riverine alluvium, and both fine and coarse grain sediments transported eastward from the perennially exposed Mojave Riverbed. These eroded bedrock exposures have attracted people for millennia, providing them with easy access to raw materials (rhyolitic and cryptocrystalline) for the production of stone tools. Erosional processes have degraded the bedrock exposures differently in different places but have also made them accessible for quarrying. At the same time, redeposition of silt and sand has concealed lower elevation portions of the bedrock, and perhaps more recently, concealed the material evidence of the people who exploited these resources.

The Mojave Desert typically receives trace levels of precipitation and is characterized by low humidity, wide diurnal temperature ranges (>25° C), high average temperatures, and strong seasonal winds (cf. Jaeger 1957; Rowlands et al. 1982; Thompson 1929; Troxell and Hofmann 1954). The annual precipitation cycle shows a distinctive cool and warm season patterning. Cool season precipitation is the most important and extensive source of rain in the desert region. Rainfall is widespread and of relatively long duration during the cool season. Warm season precipitation results largely from convection precipitation in the form of thunderstorms (USGS 2004). Cool season precipitation (October through April) averages 4 inches per year, while warm season precipitation (July through October) averages about 1.3 inches per year (California Department of Water Resources 1980; USGS 2004), with occasional violent convectional downpours causing flash floods and deep landform incisions.

Fauna within the survey parcels are diverse and include many animals that were likely exploited by prehistoric populations (Basgall 1991; Fowler 1990; Kelly 1964; Kelly and Fowler 1986; Kroeber 1925). The most prevalent are reptiles, rodents, small carnivores and birds. Reptiles like the desert tortoise (*Gopherus agassizii*), Western banded gecko (*Coleonyx variegates*), common chuckwalla (*Sauromalus obesus*), desert iguana (*Diposaurus dorsalis*), coachwhip (*Masticophis flagellum*), Mojave rattlesnake (*Crotalus scutulatus*) and sidewinder (*Crotalus cerastes*); lagomorphs such as the black-tailed jackrabbit (*Lepus californicus*) and desert cottontail (*Sylvilagus audubonii*); rodents such as the antelope ground squirrel (*Ammospermophilus leucurus*), desert kangaroo rat (*Dipodomys deserti*), desert woodrat (*Neotoma lepida*); and carnivores like the coyote (*Canis latrans*) and kit fox (*Vulpes macrotis*) are by far the most common. Large mammals such as mule deer (*Odocoileus hemionus*), bighorn sheep (*Ovis canadensis*), pronghorn (*Antilocapra americana*), and black bears (*Ursus americanus*) are present in the mountains today while grizzly bears (*Ursus arctos*) were present historically. Migratory waterfowl (e.g., *Anas* spp.) are occasional visitors to episodic playa lakes as well (Cornett 1987; Jameson and Peeters 2004; Stebbins

2003). At various times inhabitants of the foothills, deserts, and playas of the Mojave Desert also came together to exploit insects (e.g. *Ephydra* sp. and *Coloradia* sp.), and freshwater arthropods like fairy shrimp (Anostraca and Notostraca), as well as the birds drawn to punctuated hatches of them (Schneider et al. 2017; Henrickson et al., 1998; Sutton 1988b, 1995).

2.2 Cultural Setting

2.2.1 Prehistoric Context

While it is likely that long-term trends in prehistoric subsistence/settlement adaptations, and the timing of major changes in them, were largely similar across the Mojave Desert region, several attempts to summarize them during the last 30 years of archaeological research have often produced differing results. In particular, the character of late Pleistocene/early Holocene adaptations is still unclear and strongly debated, due in part to the persistence of long-standing notions of "Paleoindian" lifeways but also due to the continued scarcity of archaeological data from ancient sites in good (e.g., stratigraphically intact), dateable contexts.

The following summary of early prehistoric culture history, therefore, contains some assertions that are largely inferred and many that are highly debatable. Other important, more detailed syntheses can be found elsewhere (Basgall 1993, 2000; Giambastiani and Basgall 2000; Grayson 1993; Sutton et al. 2007; Sutton 2017; Warren 1984; Warren and Crabtree 1986) that provide additional opinions on broader datasets for the region.

The following discussion begins with summaries of local cultural chronological traditions as they are popularly understood, embedded within Paleoclimatic trends, and separated into the following periods: Fluted Point Period, Lake Mojave Period, Pinto Period, Gypsum Period, Saratoga Springs Period, Post-Saratoga Springs/Late Period, and Contact/Ethnographic Period. This setting divides the pre-contact cultural sequence into five periods. These periods are analytical constructs and do not necessarily reflect Native American views.

Terminal Pleistocene – Fluted Point Period (ca. 12,000–10,000 BP)

Disregarding claims for extremely ancient human presence in the Mojave Desert, there is substantial evidence that human occupation of the arid west began at the end of the Pleistocene era. Archaeological assemblages of such antiquity have been recognized mainly due to the presence of fluted-base projectile points similar to the well-known Clovis forms of the Great Plains and are fairly well-dated to 12,000-10,000 BP. Many of the earliest discoveries were made in the Mojave Desert at places like Lake Mojave, China Lake, Tiefort Basin, and Little Lake. Many of those recovered were surface finds, but sites at China Lake held fluted points in apparent association with the burned remains of extinct fauna; these locations remain among the more convincing for the Pleistocene antiquity of fluted point occupations (Basgall et al. 2002; Warren et al. 2004). Fluted points in the West often occur as isolated finds but they also tend to be found with flaked stone assemblages that are dominated by bifaces and formally shaped, unifacial flake tools. The comparable prevalence of bifaces in central plains Paleoindian (Clovis) assemblages could signify a need for a generalist, portable technology among extremely mobile groups. The premise of high residential mobility among Paleoindian groups has drawn support from studies of lithic assemblages transported long-distances and from obsidian source profiles for Great Basin Concave-base points and crescents in the Mojave Desert.

Recent discoveries of fluted points have increased the spatial distribution of these artifacts but have not contributed much to solidifying their place in time. Finds from the Mojave Desert have slowly multiplied (Basgall and Hall 1991),

revealing differences in the spatial distributions of fluted and stemmed points (e.g. at Fort Irwin) that may point to a cultural division between them throughout the Mojave Desert (Basgall and Hall 1994).

More recent work at Edwards Air Force Base (AFB) has identified a few sites with Great Basin Concave-base points around the shore of Rosamond Lake, also known as Pleistocene Lake Thompson (Basgall and Overly 2004), where various surface assemblages contain Great Basin Concave-base points, Great Basin Stemmed points, crescents, and even buried cultural deposits of late Pleistocene-early Holocene age.

Early Holocene – Lake Mojave Period (ca. 10,000–7,000 BP)

In the western Great Basin, various stemmed projectile point forms have been fairly well dated to the early Holocene, roughly between 10,000 and 7500 BP. Generally subsumed under the broader appellation "Great Basin Stemmed," these artifacts are elongate, lanceolate forms often with subtle, sloping shoulders, although many different regional styles exist. In the western Mojave Desert, typical stemmed points are Lake Mojave (unshouldered) and Silver Lake (slightly shouldered) forms, both of which are parts of lithic assemblages similar to those of the Fluted Point Period.

Because of their tendency to occur along the shorelines of extinct lakes, stemmed point assemblages were once considered to represent a unique, lacustrine-based subsistence adaptation. The term "Western Pluvial Lakes Tradition" (WPLT), originally coined by Bedwell (1973), was applied to stemmed point sites found in ancient lakeshore contexts across the Great Basin. Lithic assemblages of the WPLT were found to be fairly comparable to Clovis materials, and in many cases points of both kinds occur together in the same sites (Basgall and Hall 1991; Davis and Panlaqui 1978). Flaked stone "crescents" (Amsden 1937) were found primarily in such lakeshore assemblages, leading many archaeologists to draw associations between crescents and lacustrine environments. Support for the WPLT has faded in recent years, however, as additional stemmed point sites have been discovered in locations away from extinct bodies of water and the landform bias in early survey programs becomes increasingly clear. Bias in the differential preservation of ancient land surfaces along fossil washes and in the center of dry lake basins has also been recognized (Basgall and Hall 1991; Waters 1988, 1991).

Middle Holocene – Pinto Period (ca. 7,000–4,000 BP)

Archaeological assemblages dating to this period are typified by Pinto points, projectiles bearing weak shoulders and indented or split-stem bases. Associated flaked stone assemblages include leaf-shaped bifaces, formal unifaces, flake tools, and consistent quantities of core-cobble implements (Basgall 1993, 2000; Campbell and Campbell 1935; Hunt 1960; Rogers 1939). Lithic selection evidently favored fine-grained igneous stones such as basalt and rhyolite for points and bifaces. Milling stones are a major part of Pinto Period assemblages, reflecting the importance of seed processing. The timing of the Pinto Period coincides with Antevs' (1953) "Altithermal," an extended interval when climate was supposedly very hot and dry. Archaeologists once believed a scarcity of Pinto sites in the Mojave Desert signaled a near-total abandonment of the region due to the oppressive climate, but more recent studies suggest that the middle Holocene in the Antelope Valley was punctuated by wetter episodes (Grayson 1993; Mehringer 1987) and that the effects of the Altithermal were variable in different parts of the desert.

Early Late Holocene – Gypsum Period (ca. 4,000 – 1500 BP)

Diagnostic artifacts at Gypsum Period sites include Gypsum contracting-stem projectile points, Elko Eared and Corner-notched points, and Humboldt Basal-notched points. Lithic assemblages are typified by bifaces, scrapers, and a variety of other flake-based tools, but also contain mortars and pestles as evidence of expanded plant

processing (including mesquite, pine nuts, yucca, and agave). Large villages or village complexes appear during Gypsum times that may reflect a transition from seasonal transhumance to year-round sedentary occupation within the Antelope Valley (Sutton 1988a, 1996, 2017). The presence of marine shell artifacts at Gypsum period sites (near Edwards AFB for example) indicates economic ties between the Antelope Valley and the California coast (Warren 1984). Gardner (2006) analyzed data from a slew of sites in the western Mojave to assess the socioeconomic impact of the Medieval Climatic Anomaly (MCA) and in so doing, suggested a revision in the terminus of the Gypsum period to about 2000 BP. Gardner (2006) based this revision on the early appearance of the bow and arrow within the Rose Spring Complex in conjunction with an increase in effective moisture at 2000 BP.

Middle Late Holocene – Saratoga Springs Period (ca. 1500 – 800 BP)

By at least 1500 BP (or 2000 BP using Gardner's 2006 chronological scheme), the aboriginal people of the Mojave Desert had replaced the atlatl (or spear-thrower) with the bow and arrow (Yohe 1992). This change brought about a shift toward the use of smaller projectile points, including various corner-notched and side-notched Saratoga Springs types and the corner-notched Rose Spring and Eastgate types. Ancestral Puebloan (also called "Anasazi") ceramics also appear in the southern Mojave around 1200 to 1100 BP, coinciding with the westward spread of the Virgin Anasazi into southern Nevada. Influence from the cultures of the Colorado River eventually grew stronger than those from the east, allowing for an influx of buffware ceramics and other goods that persisted until the historic present. The intensification of plant use initiated during the Gypsum period continued in the Saratoga Springs period, as diet breadth was expanded to include a wide range of plant foods that required high cost/high return procurement and processing strategies. This is indicated by a general increase in milling equipment from Gypsum times through the Saratoga Springs period (see Gardner 2006).

Recent Late Holocene – Post-Saratoga Springs Period / Late Period (ca. 800 – 300 BP)

Social and economic adaptations during this final prehistoric interval were largely an extension of patterns that developed during the Saratoga Springs period. Trade along the Mojave River continued to provide the people of Central and Eastern Mojave Desert with a variety of exotic goods and materials, although it appears that relationships with groups in coastal California eventually grew stronger than those with groups inhabiting the arid interior. Projectile points also shifted in form, with unnotched Cottonwood Triangular and Desert Side-notched points being even smaller than their predecessors. Mortars and pestles also appear in significant quantities, probably an indication of increased emphasis on high-cost/high-yield processing.

2.2.2 Ethnohistoric Context

Ethnic territorial claims by the different groups who occupied the Mojave Desert could be fluid in response to environmental pressure and sometimes resulted in conflict that would end in the movement of a group of people out of an area which would then be occupied by a competing group. Ethnographic sources, compiled for the most part by anthropologists, suggest varying and sometimes overlapping territorial boundaries (see Kroeber 1925, Bean and Smith 1978, Earle 1990, Sutton and Earle 2017). Evidence suggests boundaries would shift over time and groups would sometimes share territory or resources and would invite neighbors to share resources when abundant.

Regardless of the overlapping and often conflicting accounts of which Serrano group, clan, or local inhabitants occupied the area along the Mojave River near Barstow, the Project area is unequivocally within Serrano ancestral territory, and several named Serrano settlements have been documented historically. Harrington writes that he was

informed of an ethnohistoric Serrano village called *Tutupeat*, reported to have been located to the west or northwest of the present town of Barstow, on a flat plain bordered by hills (Sutton and Earle 2017). Harrington's interviewee (Santos Manuel) further noted that while the *Tutupeatam* people from this village were part of the larger *Kai'uyam* clan who occupied the northwestern quadrant of Serrano territory during the nineteenth century, the *Yohaviatum* (also spelled *Yuhaaviatam*) clan – most typically associated with the southwestern quadrant of Serrano territory in the mountains around Cajon Pass – also used this area. The exact location of another named settlement, *Sisugenat*, is similarly uncertain, but generally relevant (Sutton and Earle 2017). This village location has been assigned to at least two different archaeological manifestations: P-36-000118 ("Lenwood Sand Dunes/Manning Ranch") and P-36-001549. The former (P-36-000118) has been reported to contain evidence of domestic activity, including manos, metates, mortars, scrapers, projectile points, and an abundance of debitage, and according to coordinates provided in an early report (Smith 1963) is located approximately 2.15 miles from the Project area, and beyond the records search for the current Project. More recent assessments put the location of *Sisugenat* much further upriver (to the southwest), perhaps near the contemporary communities of Hellendale or Bryman (Sutton and Earle 2017). However, the latter (P-36-001549) is a little less than a mile due west of the Project area, in a zone of very active, mobile sand dunes immediately adjacent the Mojave River channel. This zone contains many archaeological manifestations, some with evidence of domestic activity and inhumation (see below), Currently, it is unknown whether this represents the location of an ethnohistoric Serrano settlement, though repatriation efforts have linked this location to the settlement of *Sisugenat* (NPS 2021).

Serrano

Although contact between the Serrano and Euroamericans may have occurred as early as 1771 (when Mission San Gabriel was established) or 1772 (the date of Pedro Fages' trip into Serrano territory), most historical sources mark the first encounter in 1776 when Francisco Garcés visited a community of about 40 people near present-day Victorville. Kroeber (1925) estimates the Serrano population before contact to be about 1,500 people, while Bean and Smith (1978) suggest a total of about 2,500. Spanish influence on the Serrano was limited until about 1819, when an *asistencia* was built near Redlands, to which the Serrano were marched involuntarily to build the Mill Creek Zanja (SMBMI 2004). By 1834 most of the western Serrano had been moved to southern California missions like San Gabriel (Bean and Smith 1978; Cook 1943). Strong (1929:5) noted that the 1910 federal census identified only 119 Serrano.

On the basis of both ethnographic and archaeological information, Sutton (2017) argues that both the Serrano who preferred the uplands and highlands of the San Bernardino Mountains (i.e. the "mountain" Serrano) and the Serrano who occupied the Mojave River (i.e. the Vanyume or "desert Serrano") shared a large desert region as a "common pool resource" area north of the mountains and east of the river called *te'mtak*; this region was described by Santos Manuel (see Harrington, cited by Bean et al., 1981 and NEA & CRS 2004). In general, the Serrano were organized around autonomous localized lineages that maintained favored, generalized usage areas. These lineages were organized into exogamous clans. Each clan had a hereditary leader, called the *kiika'*, who conducted ceremonies and religious activities (Bean and Smith 1978). Comprehensive discussions of clan- or moiety-based territories derived from ethnographic studies include Sutton and Earle (2017), Earle (2005), and Earle (1990).

Prior to contact, the desert-dwelling Serrano maintained a hunting and gathering economy. Staple plant foods included acorns, pinyon nuts, yucca (flowers, stalks, and roots), mesquite, screwbeans, and cactus fruit, these often supplemented with various roots, bulbs, shoots, and seeds like chia (*Salvia columbariae*) and ricegrass (*Oryzopsis* spp.). Principal game included deer, mountain sheep, rabbits and larger rodents, and many birds (Bean and Smith 1978). Various basketry tools were used to gather, winnow, and cook plant foods (Bean and Vane 2002), many of

which were stored in large, elevated basketry granaries at village locations. Pottery was also used for food storage, particularly to hold mesquite and pinyon flour (Benedict 1924). Hunting was accomplished with throwing sticks, various types of traps, nets and snares, and sinew-backed bows and arrows (Bean and Smith 1978; Drucker 1937). Principal trading partners were the Mohave people to the east and the Gabrielino to the south and west, but they also traded often with their closer neighbors, the Cahuilla and, in more recent times, the Chemehuevi.

Families traditionally lived in single-family dwellings that were circular, domed or conical structures with central firepits. The walls were constructed of willow frames with exterior tule thatching secured with yucca withes (Bean and Smith 1978; Drucker 1937). Each house generally had a small "ramada" attached to it, an unwalled shade structure consisting of a willow-framed roof covered with thatching and supported by poles (Benedict 1924; Drucker 1937; Kroeber 1925). The homes of several families were generally clustered in small groups, each of which usually had shared facilities such as granaries, a sweathouse, and a larger ceremonial house where the lineage leader resided (Bean and Smith 1978; Strong 1929). Serrano houses of more recent times (e.g. 1920s) were rectangular, with sloped tule-thatched roofs supported by forked posts, a central cross-beam, and horizontal wall beams set about 4 ft from the ground (Benedict 1924; Drucker 1937).

The Serrano had similar technology to their neighbors, particularly the Cahuilla. Basic items of material culture included baskets, pottery, rabbit skin blankets, awls, arrow straighteners, bows and arrows, mortars and pestles, stone pipes, musical instruments, bags and pouches, mats, and cordage (Bean and Smith 1978). Baskets were fabricated from yucca fiber, willow, and other reeds and grasses found in the area, while pots were made by coiling, smoothed with a paddle and anvil, and left undecorated (Benedict 1924; Stickel et al. 1980). Arrows were made of hardwood and tipped with stone points (Drucker 1937), and food-grinding tools featured basketry hoppers with portable stone mortars (attached with adhesive), deep wooden mortars, and bedrock mortars (Benedict 1924; Drucker 1937). Fibers of yucca, agave, and other plants were used to make clothing and other textiles, mats, and cordage. Musical instruments consisted of rattles made from turtle/tortoise shell or deer hooves, bone whistles, and flutes.

First-hand accounts of the Serrano settlement-subsistence system comes from the observations of William McHaney, a Euroamerican prospector who spent time hunting and gathering in the 1880s with the Serrano in the desert north of Twentynine Palms (cited in Walker 1931). McHaney calls attention to the seasonal movements of Serrano for different kinds of plants and animals, but also water, and for raw materials to make tools.

The Serrano language is classified as part of the Serran branch of the Uto-Aztecan language family, making it broadly similar to the language of their neighbors: Kitanemuk and Tataviam, Serrano has also been grouped with a somewhat larger set of languages spoken by other neighboring groups in southern California, including Tongva, Luiseño, Juaneño, Cahuilla, and Cupeño (see Golla 2011 and Hill 2011 for somewhat different interpretations). Language affinities over such a larger area have led many scholars to suggest that Serrano was part of a larger "Shoshonean" or "Takic" expansion into southern California, ca 3,500 to 1,500 years ago (Kroeber 1925, Sutton 2009).

2.2.3 Historic Period Context

Spanish missionization of Alta California was initiated in San Diego (1769). A total of 21 missions were constructed by the Dominican and Franciscan orders between 1769 and 1823. Mexico's separation from the Spanish empire in 1821 and the secularization of the California missions in the 1830s caused further disruptions to native populations. Following the establishment of the Mexican republic, the government seized many of the lands

belonging to Native Americans, providing them as parts of larger Land Grants to affluent Mexican citizens and rancheros. The 1833 Secularization Act passed by the Mexican Congress ordered half of all mission lands to be transferred to Native Americans, and the other half to remain in trust and managed by an appointed administrator. These orders were never implemented due to several factors that conspired to prevent Native Americans from regaining their patrimony.

California was officially ceded to the United States in 1848, which led to the continued appropriation of Native American Lands by ranchers, prospectors, and an increasing number of settlers. The United States Government did little to dissuade these trespasses. From 1850, with the passage of California's Indian Act, until legislative reforms in the late 1880s, state laws promoted conditions that amounted to indentured servitude for much of the Native American population throughout California. The mining-related resources within the Project area are limited to early local roads associated with mining activities, which played an important role in the history of the Mojave Desert. Information in this section addresses the subject in order to provide a full picture of the Project vicinity's development history.

The California Gold Rush that began in 1848 sparked a period of unprecedented mining activity in the West. As the number of productive strikes in Northern California and across the state line in the eastern Sierra Nevada began to decline in the 1850s and 1860s, surveyors and prospectors began exploring the Mojave Desert for resources. Materials mined from the Mojave Desert included gold, barium, barite, borates, copper, feldspar, lead, magnesite, silver, manganese, strontium, and tungsten.

Throughout the late nineteenth and early twentieth century, mining in California and Nevada remained an industry subject to extreme periods of boom and bust. The longevity of a mining town depended directly on the operation of a mine, which simultaneously required a market for the material mined there and favorable environmental conditions, such as adequate rainfall. The cost and overall difficulty associated with transportation remained a hindrance to any sustained success until wider railroad expansion occurred after the turn of the twentieth century. The silver and gold mining booms, led to the development of new short-line railroads, with the T&T connecting to the Salt Lake Route in eastern California.

The Tonopah and Tidewater Railroad, known colloquially as the T&T, was built by Francis Marion "Borax" Smith in 1906–1907 to tap his borax mines near Death Valley and the silver and gold mines of central Nevada. The line never reached the coast or Tonopah, stopping just short of Beatty, Nevada, but served as the "neighborhood railroad" for much of the desert. The T&T crossed the UP Railroad at Crucero (Myrick 1992).

For almost 35 years, from 1907 to 1940, the T&T served as an important transportation link between the isolated mining communities of the Mojave Desert and southern California and Nevada. The history of the T&T is a story of success in overcoming formidable obstacles in the desert regions of California and Nevada. These obstacles included steep mountains, dry lakes and washes subject to flooding, and long expanses of uninhabited land devoid of trees and reliable sources of water. The great geologic forces that formed high-grade mineral deposits also created adverse conditions that impeded the economic development of those resources (Myrick 1992).

INTENTIONALLY LEFT BLANK

3 Research Design

The objective of the evaluation portion of this report was to obtain information from the three archaeological sites (P-36,003677, P-36-005076, and LE-S-001 herein identified as "Project Resources") that could be used to evaluate their significance under CEQA and local regulations. Current research is typically structured in a way that links anthropologically oriented research issues to the archaeological record. The following discussion embraces this strategy and identifies potential questions and appropriate archaeological evidence within a series of broad research themes. General issues pertinent to the assessment of the sites include determination of the extent and integrity of cultural deposits, age and probable affiliation, site function, and subsistence strategies.

Isolates are categorically ineligible for listing on the CRHR and not considered to be to be significant under CEQA. Under CEQA, isolates do not require additional treatment other than formal documentation.

3.1 Chronology

The prehistoric Project Resources within the current Project area appear to represent relatively short-term occupations. Chronological indicators are likely to be provisional, such as a diagnostic projectile point, or technological attributes that may be time sensitive, or perhaps evidence of artifact weathering. This study will rely on relative chronometrics assuming that no radiocarbon dates or other absolute dates will be obtained. Historic period sites typically contain artifacts that together represent broad time frames, indicating that dump events were composed of materials from mixed occupations. Because chronological controls are essential to any archaeological investigation, it is important to ask a few basic questions concerning the temporal data potential of evaluated sites:

- Can the chronological placement of Project Resources be determined?
- What kinds of chronometric data can Project Resources provide? Of those obtained during survey, how well do they correlate in terms of the age estimates they provide (e.g., projectile point types versus obsidian hydration dates)?
- Are there data indicating the presence of multiple occupation episodes at Project Resources?
- Do marker artifacts appear to fit with temporal patterns recognized within the Mojave Desert and in the surrounding region? Are there any unique diagnostic items present?
- Can chronometric data from Project Resources help to refine dating schemes in use within the Mojave Desert?

3.2 Technology, Subsistence, and Settlement Organization

In examining prehistoric sites, the study of lithic technologies (flaked and ground stone) often provides clues to the placement of sites within associated subsistence-settlement regimes and offers insight to the various functions and emphases of site occupations. At historical period sites, the kinds of artifacts present, the activities they represent, and their overall proportions can give some indication of where refuse originated, by whom it was generated, and why it was abandoned at its place of discard. Among many others, the following questions apply:

- What kinds of manufacturing and tool use activities are represented at the prehistoric Project Resources in the Project area?
- What can be inferred from the composition of lithic assemblages about the kinds of resources and habitats exploited by the Project Resources inhabitants?
- Do observed lithic technologies at prehistoric Project Resources have any implications for residential mobility and settlement ranges? What does the lithic material profile indicate about the source origins and how raw materials might have arrived at the Project Resources?
- What is the nature of refuse at historic period Project Resources? Are proportions of consumptive, household, industrial, and other artifacts substantial enough to derive context of origin(s)?
- Are any maker's marks on historical artifacts indicative of specific places of manufacture? Do they provide any information about where particular goods might have been purchased or otherwise obtained?

3.3 Structure and Integrity of Cultural Deposits

Data bearing on the temporal and physical integrity of the Project Resources are critical to assessments of significance, data potential, and management needs. The degree to which temporally discrete components remain, depending on their material structural integrity, must be considered in making recommendations for future investigations and/or resource protection. The extent to which site integrity enhances or devalues the interpretive potential of a cultural deposit determines the potential of its scientific value:

- Do inclusive chronometric data from the Project Resources permit the identification and definition of temporally and/or spatially discrete prehistoric occupations or historic dumps?
- Are the definitions of discrete components supported by multiple, independent chronological controls, and if so, how similar are their age estimates?
- Is there substantial evidence of occupational "overprinting"? How has this practice affected the temporal integrity of habitation components or refuse deposits?

4 Methods

This section describes the techniques employed to identify and record archaeological resources within the Project area. All methods exceed the Secretary of the Interior's (SOI) Standards and Guidelines for Archaeology and Historic Preservation, as do all Project personnel for their respective roles.

4.1 Inventory

The inventory portion of this cultural resource investigation consisted of a records search of the Project area and surrounding one-mile radius at the SCCIC, initiation of correspondence with the NAHC, and an intensive pedestrian survey of the Project area. In addition to the SCCIC records, the records search also examined the NRHP, Office of Historic Preservation Archaeological Determinations of Eligibility and Historic Property Directory lists, and historic maps. Historic aerial photographs and topographic maps were also reviewed online (NETR 2023). All previously recorded cultural resources and previous cultural resources investigations were plotted on records search maps and reviewed to assess the potential for discovery of cultural resources within the Project area. Records search results are included in Confidential Appendix A.

Dudek archaeologists Loukas Barton, David Faith, Scott Wolf, Jessica Colston, and Patrick Hadel conducted an intensive-level cultural resources pedestrian survey of the entire Project area on April 14 and July 6, 2023, using standard archaeological procedures and techniques. All field practices met the Secretary of Interior's standards and guidelines for a cultural resources inventory (NPS 2018). Intensive-level survey methods consisted of a pedestrian survey conducted in parallel transects tracked east to west and spaced no more than 15 meters apart over the entire Project area.

Within each transect, the ground surface was examined for prehistoric artifacts (e.g., flaked stone tools, tool-making debris, stone milling tools, ceramics, fire- affected rock), soil discoloration that might indicate the presence of a cultural midden, soil depressions, features indicative of the current or former presence of structures or buildings (e.g., standing exterior walls, post holes, foundations), and historic artifacts (e.g., metal, glass, ceramics, building materials). Ground disturbances such as burrows, cut banks, and drainages were also visually inspected for exposed subsurface materials. All fieldwork was documented using hand-written field notes and an Apple iPad equipped with ESRI Field Maps. Location-specific photographs were taken using an eighth-generation (or better) Apple iPad equipped with eight (8) mega-pixel (MP) 1080p resolution (or better) and georeferenced PDF maps of the Project area. Accuracy of these devices ranged between 1 and 7 meters, with spatial correction allowed through use of base map aerial imagery, vegetation, and landforms. All field notes, photographs, and records related to the current study are on file at Dudek's Encinitas, California office.

4.1 Classification and Recording

Cultural resources identified during this inventory effort were classified as either "sites" or "isolates." For the purposes of prehistoric site definition, a minimum density of five or more prehistoric artifacts in a 25 square meter area was used to constitute an archaeological site, as was the presence of any feature (e.g., bedrock mortar outcrop). Any separation of 50 meters or more between prehistoric artifacts was considered justification for delineation of a site boundary/designation as an isolate. Isolated finds consisting of fewer than five prehistoric artifacts within a 25 square-meter area were recorded separately from sites, including the use of a different numbering scheme. For the purposes of historic-era site definition, a minimum density of 10 or more historic-era artifacts in a 25 square meter area was used to constitute an archaeological site, as was the presence of any

feature (e.g., concrete foundation) or diagnostic historic-era artifact (e.g., bottle glass with maker's mark). Any separation of 50 meters or more between historic-era artifacts was considered justification for delineation of a site boundary/designation as an isolate. Isolated finds consisting of fewer than 10 non-diagnostic historic-era artifacts within a 25 square-meter area were recorded separately from sites, including the use of a different numbering scheme.

Nine cultural resources were relocated or identified within the Project area during the intensive-level pedestrian survey. P-36-003677, P-36-005076, and LE-S-001 were recorded as archaeological sites and LE-I-001, LEI-002, LE-I-003, LE-I-004, LE-I-005, and LE-I-006 were recorded as archaeological isolates. All resources were recorded in their entirety on DPR 523 forms, using the Instructions for Recording Historical Resources (Office of Historic Preservation 1995). DPR forms are included in Confidential Appendix C.

Isolates are not considered significant under CEQA and local regulations and are categorically ineligible for the CRHR; therefore, no formal evaluation was conducted for LE-I-001, LE-I-002, LE-I-003, LE-I-004, LE-I-005, and LE-I-006. The other three resources, P-36-003677, P-36-005076, and LE-S-001, were evaluated for significance under CEQA and local regulations, and eligibility for the CRHR as part of this report.

5 Archival Research

5.1 South Coastal Information Center Records Search

Dudek archaeologist Brenda Rogers conducted an in-person records search of the Project area and surrounding one-mile radius at the SCCIC at California State University, Fullerton on March 6, 2023. The search included a review of previously recorded cultural resources and previously conducted studies within a one-mile radius of the Project area. The CHRIS records search also included a review of the NRHP, the CRHR, the California Points of Historical Interest list, the California Historical Landmarks list, the Archaeological Determinations of Eligibility list, and the California State Historic Resources Inventory list. The results of the records search are attached as part of Confidential Appendix A.

5.1.1 Previous Technical Studies

SCCIC records indicate that 35 previous cultural resources studies have been conducted within a one-mile radius of the proposed Project area. Of the 35 studies, four intersect the Project area: SB-01161, SB-01344, SB-03278, and SB-05279 (Table 1). Of the four studies that intersect the Project area, two are cultural resources inventory reports, and two are evaluation reports. The results of the records search, including a list of the studies that do not intersect Project area, are attached as part of Confidential Appendix A.

Table 1. Previous Resource Studies that Intersect Project Area

SCCIC Report ID	Year	Author	Report Title
SB-01161	1981	Lerch, Michael K.	Cultural Resources Assessment of Tentative Tract No. 11874, Lenwood Area, San Bernardino County
SB-01344	1983	Lerch, Michael K.	Cultural Resources Assessment of The Lenwood Village Large Scale Housing Project, Lenwood Area, San Bernardino County, California
SB-03728	2000	Love, Bruce	Identification And Evaluation of Historic Properties: Lenwood Sewer Line Installation in The Community of Lenwood, San Bernardino County, Ca. 25pp
SB-05279	2006	Dibble, Stephen D.	An Evaluation of The Cultural Resources Potential Of Three Parcels For Proposed Annexation By The City Of Barstow, San Bernardino County, California

SB-01161

This report is a cultural resources assessment for a residential development project authored by Michael Lerch of the San Bernardino County Museum Association in 1981. It covered the southern 75% of the currently proposed Project area. The 1981 field efforts included a pedestrian survey of Tract 11874 located at the intersection of Lenwood Road and Jasper Road. This report identified one resource: P-36-003677. Lerch notes that the site was originally recorded for the San Bernardino County Transportation Department in 1979 by Gerald Smith as a lithic scatter. However, the site was expanded during the 1981 pedestrian survey and reclassified as a quarry. Lerch mapped the most intensely utilized portions of the site outside of the tract. Their evaluation included the collection of a sample of artifacts which are currently stored at the San Bernardino County Museum under accession number

SBCM-3836. Lerch concluded that additional investigations at the intersecting portion of the tract with P-36-003677 would not significantly increase knowledge and information about the resource. As such, no additional cultural resource efforts were conducted as part of this project (Lerch 1981a).

SB-01344

This report is a cultural resources assessment for a residential development project authored by Michael Lerch of the San Bernardino County Museum Association in 1983. This project included 20-acre and 10-acre parcels near the intersection of Lenwood Road and Agate Road. Their record search identified sites P-36-003677 and P-36-005076 outside of their project area. The pedestrian survey identified three isolated flakes. Lerch surmised that the flakes were likely from site P-36-005076. They identified no significant cultural resources on the project itself and recommended no additional mitigation beyond the erection of a chain link fence to prevent incidental impact south towards site P-36-005076 (Lerch 1983).

SB-03728

This report outlines the cultural resources inventory and evaluation in support of the Lenwood Sewer Line Installation Project, authored by Bruce Love of CRM Tech in 2000. The proposed project involved the installation of various pipelines and auxiliary tie-ins confined within public roadways traversing in and around Sections 8, 9, and 17 of Township 9N, Range 2W of the San Bernardino Base Meridian. A pedestrian survey in support of this Project was conducted within and directly adjacent to Lenwood Road and Agate Road, directly to the west and north of the currently proposed Project area, respectively (but does not necessarily intersect). The survey crew attempted to relocate P-36-003677 at its previously recorded location but failed to identify any associated culturally modified material. Overall, the report identified two resources (Santa Fe Railroad and Route 66/Main Street) that intersect the APE of the sewer installation project. Both resources were evaluated and found eligible for listing on the NRHP. Although the report identified these resources as historic properties under Section 106 of the NHPA, Love concluded that these properties would not be affected by the proposed undertaking and recommended no additional cultural resources work, including monitoring, to take place in support of project implementation (Love et al. 2000).

SB-05279

This report is a cultural resources evaluation for three parcels as part of a proposed annexation by the city of Barstow, authored by D. Stephen Dibble in 2006. Site 2 contains the current Project area and covers 100% of the Project area. The evaluation included a records search and a cursory site visit to previously recorded resources. The site visit observed disturbances from off road use and recreational impacts. Dibble posits that the observed impacts would have compromised the sites' integrity to a great degree. Dibble states that it is likely that both P-36-003677 and P-36-005076 are not significant resources (pp.10-11). His recommendations for the City of Barstow states that no additional work is necessary for the proposed annexation, however future plans for development would require an updated archaeological field survey (Dibble 2006).

5.1.2 Previously Recorded Cultural Resources

The SCCIC records search identified 49 previously recorded cultural resources within a one-mile radius of the Project area (Table 2). Of these, two intersect the Project area. These include two prehistoric lithic quarries/lithic scatters (P-36-003677 and P-36-005076). Neither of these resources have been evaluated for listing on the CRHR or NRHP.

Of the remaining 47 previously recorded resources, 13 are characterized as prehistoric lithic quarries/lithic scatters, eight are prehistoric isolates, seven are historic refuse scatters, five are multicomponent sites, five are historic linear features (roads, railroads, trails etc.), four are ranches/farms, three are structures/foundations, one is a prehistoric habitation deposit, and one is a bedrock milling feature.

Table 2. Previously Recorded Resources within One-Mile Radius of Project Area

Primary Number	Trinomial	Age	Description
Intersects Project Area			
P-36-003677	CA-SBR-003677	Prehistoric	Lithic Scatter / Quarry
P-36-005076	CA-SBR-005076	Prehistoric	Lithic Scatter / Quarry
Outside of Project Area			
P-36-001549	CA-SBR-001549	Prehistoric	Lithic Scatter; Bedrock Milling Feature; Burial

P-36-064613	-	Prehistoric	Isolate

P-36-003677 (CA-SBR-003677)

P-36-003677 was first recorded in 1979 by G. Smith of the San Bernardino County Museum. The site record was later updated in 1981 by Michael Lerch in support of the proposed development of Tracts 11874 and 12016 (within Current Project area). P-37-003677 is described as a prehistoric quarry of jasper and chalcedony which extends over an area of 500 x 100 meters. Artifacts recorded in 1981 include lithic debitage, cores, and hammerstones. The site record from 1981 also notes that there is a similar site just north of P-37-003677, presumably referencing

P-36-005076. The southern portion of the site, as recorded in 1981, was likely impacted by the construction of the mobile home park north of Jasper Road and directly south of the currently proposed Project area (Lerch 1981b).

P-36-005076 (CA-SBR-005076)

P-36-005076 was recorded in 1982 by Michael Lerch of the San Bernardino County Museum in support of the proposed development of Tract 12170 (directly east of current Project area). This prehistoric resource is described as a light lithic scatter, comprised primarily of jasper debitage, but with some chalcedony and chert flakes as well. The site boundary recorded in 1982 spans 200 x 100 meters and consists predominantly of unmodified raw material. Overall, this site is described as being sparser with a noticeable lack of worked material when compared to P-36-003677 to the south (Lerch 1892).

5.2 Review of Historic Maps and Aerial Imagery

Dudek conducted an online review of Bureau of Land Management (BLM) General Land Office Records, historical topographic maps, and historic aerial photographs to understand the development of the Project area and surrounding properties through time. The Project area was first subdivided into Township 9 North, Range 2 West, Section 8 (W ½) in an 1855 original survey for the BLM by John C. Hays. The Plat image of the original survey shows the Project area as undeveloped and without any defining topographic features (BLM 2023).

Dudek reviewed the historic topographic maps (historic topos) depicting the Project area available for the years of 1932 to 1993 (USGS 2023). The first available historic topo from 1932 depicts the Project area as undeveloped. There appears to be an established unnamed dirt road intersecting the center of the Project area on an east to west axis. By 1956, this unnamed dirt road no longer appears as existing within the Project area. The 1956 historic topo also depicts a single structure approximately 100 feet from the southeast corner of the Project area. This structure is no longer depicted after 1971. There are no significant changes to the Project area and surround properties until 1993. By 1993, a mobile home park appears directly to the south of the Project area, where the High Desert Estates housing development currently exists (USGS 2023).

Historic aerial photographs (historic aerials) depicting the Project area are available for the years of 1952 to 2020 (NETR 2023), and generally corroborate the information depicted in the historic topos, with a few additions. The 1952 historic aerial shows water flowing in the Mojave river, which is positioned about 0.5 miles north of the Project area. Lenwood Road is also present in 1952, shown adjacent to the Project area along the western boundary. Contrary to the historic topos, the historic aerials show the Project area throughout the 1950s as without any established dirt roadways/evidence of off-road vehicle travel. By 1970, there is additional development northeast of the Project area along Agate Road. By 1984 numerous unnamed dirt pathways/roadways are seen winding through the Project area, mainly traversing on an east to west axis. Excavated features are also observable on the 1984 aerial, but not before this. Though no formal development is visible within the Project area, immediately to the south there is a mobile home community in development, as well as an agricultural development directly across Lenwood Road to the west. The 1984 historic aerial also shows a vegetated area (confirmed to be a depression through fieldwork) in the central portion of the Project area. There is an expansion of this vegetated area throughout the historic aerial images until 1995. This information may indicate that the Project area was a popular “rockhounding” location between 1970 and 1995. This location being a destination for rockhounds is supported by the presence of the high-quality lithic material within the Project area and would have involved exploratory excavation and collection of rocks and minerals. In this case the agate and other rocks. After 1995, there are no visible changes to the Project area as depicted in the historic aerials (NETR 2023).

Overall, the Project area appears to have remained undeveloped throughout the latter half of the 20th century as depicted in the historic topographic maps and historic aerial photographs. The presence of dirt pathways/roadways throughout also indicate the informal use of the Project area for overland vehicle travel and recreational purposes by surrounding communities since at least the 1980s. Additionally, there is evidence in the historic aerials to indicate that the Project area was used for rockhounding and fossil collecting since at least the 1980s as well.

6 Results

The approximately 100-acre Project area is comprised of low desert pavement surfaces to the south (Figure 3), sand dune formations to the north (Figure 4) and eroded rhyolite bedrock outcrops throughout. Ground surface visibility was moderate (40-60%) within the desert pavement surfaces and in areas of denser vegetation, and excellent (70-100%) within areas of regular vehicle overland travel and among the sand dunes formations. Vegetation within the Project area consisted of creosote bush (*Larrea spp.*) and various species of invasive grasses. Surface soils within the Project area were characterized as light brown silty sand. Within the sand dune formations, soils were loosely compacted. Disturbed desert pavement surfaces were present throughout the Project area and consisted of highly compacted, light brown silty sand, and sub-angular rhyolite and cryptocrystalline silicate nodules. Evidence of disturbances within the Project area included modern trash/evidence of trash dumping, rodent burrows, vehicle overland travel routes, excavation pits and holes, and pedestrian/recreational pathways.

The pedestrian survey relocated two previously recorded cultural resources and identified seven previously unrecorded cultural resources within the Project area. P-36-003677 (prehistoric quarry/lithic scatter), first recorded in 1979, was re-recorded in support of this Project. The resource boundary was expanded slightly to the northwest, and an historic-era component was recorded as well. P-36-005076 (prehistoric quarry/lithic scatter), first recorded in 1982, was re-recorded in support of this Project as well. The resource boundary was significantly expanded to the west, north, and south, and an historic-era component was recorded as well.

The pedestrian survey recorded seven newly identified cultural resources: LE-S-001, LE-I-001, LE-I-002, LE-I-003, LE-I-004, LE-I-005, and LE-I-006 (Table 3). LE-S-001 is described as a small prehistoric lithic scatter, while LE-I-001, LE-I-003, LE-I-006 are historic isolates, and LE-I-001, LE-I-002, and LE-I-005 are prehistoric isolates.

Isolates are categorically ineligible for the CRHR; therefore, they are only summarized in Table 3. Cultural resource locations can be seen in Confidential Appendix B (Cultural Resources Overview Map). Confidential Appendix C contains each resource's respective California DPR site and isolate forms.

Table 3. Newly Identified Resources within Project Area

Dudek Number	Age	Designation	Description
LE-S-001	Prehistoric	Site	Lithic Scatter
LE-I-001	Historic	Isolate	Bi-Metal Cans (4)
LE-I-002	Prehistoric	Isolate	Lithic Shatter (2)
LE-I-003	Historic	Isolate	Associated Ceramic Fragments (30+)
LE-I-004	Prehistoric	Isolate	Lithic Flakes and Shatter (3)
LE-I-005	Prehistoric	Isolate	Lithic Shatter (2)
LE-I-006	Historic	Isolate	Church-Key Opened Cans (5)

Figure 3. Overview of Project area. Photo taken at southeast corner, view facing north.

Figure 4. Overview of Project area. Photo taken near northern boundary, view facing south.

6.1 Identified Archaeological Resources

Three archaeological resources were identified within the Project area as a result of Dudek investigations (P-36-005076, P-36-003677, and LE-S-001). These resources were subject to intensive-level, close-interval survey and detailed recordation.

6.1.1 P-36-003677 (CA-SBR-003677)

P-36-003677 is a multicomponent site that includes a large, diffuse, low-density lithic scatter, several historic-era/ modern mining and rock features, and a diffuse historic-era refuse scatter. The site measures approximately 250 meters (N/S) by 650 meters (E/W). The prehistoric component consists of a cryptocrystalline silicate (CCS) biface, CCS and rhyolite single reduction loci (4), one (1) core tool, three (3) simple flake tools, 11 lithic cores, three (3) assayed cobbles, one (1) battered cobble, and several scatters of primary, secondary, and interior flakes, and pieces of lithic shatter all made of rhyolite, mudstone, CCS, and indeterminate volcanic material.

The historic-era/modern component consists of rusted bolt-in-can lid possible mining claim tags, four (4) mining adits/excavation pits, seven (7) rock features, two (2) wooden posts, one (1) embedded iron I-beam, a Suncrest Soda Bottle (1938-1968), rusted bi-metal cans (1960-1980), and additional recorded and unrecorded historic-era/modern refuse scatters and ephemeral mining features.

Disturbances include vehicle overland travel paths, modern human activity as evidenced by modern trash and debris, evidence of illicit excavation and collection, and rodent bioturbation. Erosional events and modern human activity have impacted the primary deposition and context of the material culture recorded at P-36-003677.

P-36-003677 is located within the Mojave River Corridor in the Mojave Desert, within a sand dune/desert pavement landscape 1 mile south of the Mojave River. Vegetation includes creosote and some species of invasive grasses. Soils are characterized as light brown silty sand/sand. Throughout the desert pavement/sand dune landscape, there are naturally occurring bedrock outcrops, and eroded raw material cobbles and nodules that were deposited onto the landscape via the Mojave River.

The prehistoric component of P-36-003677 is characterized as a low-density lithic scatter typical of expedient raw material quarrying and early-stage lithic reduction. The most common artifacts found at these sites include primary and secondary flakes, shatter, and expediently utilized/assayed cobbles. Low-density lithic scatters of this type are common among the Mojave River Corridor. Typically, archaeological deposits of this nature are surficial and have low potential for buried cultural deposits. Bedrock exposure over a large area attests to the surficial nature of most of the site. The majority of artifacts and features associated with the historic-era/modern component of P-36-003677 are likely the result of rockhounding/informal recreational activities that occurred from the 1980s on, although there is some evidence (bi-metal cans and Suncrest Soda Bottle) to indicate that this location was used as an historic-era dump site. Table 4 provides a summary of observed artifacts and Table 5 provides an overview of documented features identified on the surface during site recordation as part of this inventory and evaluation effort.

6.1.2 P-36-005076 (CA-SBR-005076)

P-36-005076 is a multicomponent site that includes a large, diffuse, low-density lithic scatter, several historic-era/modern mining/excavation features, and a diffuse historic-era/modern refuse scatter. The site measures approximately 400 meters (N/S) by 600 meters (E/W). The prehistoric component consists of a CCS SRL (debitage count: 6), three (3) simple flake tools, seven (7) lithic cores, an assayed cobble, and several scatters of primary, secondary, and interior flakes, and pieces of shatter all made of rhyolite and CCS. The historic-era/modern component consists of eight (8) mining adits/excavation pits, rusted bi-metal and generic cans, and additional non-diagnostic historic-era/modern refuse and ephemeral mining features.

Disturbances include vehicle overland travel paths, modern human activity as evidenced by modern trash and debris, evidence of illicit excavation and collection, and rodent bioturbation. Erosional events and modern human activity have impacted the primary deposition and context of the material culture recorded at P-36-005076.

P-36-005076 is located within the Mojave River Corridor in the Mojave Desert, within a sand dune/desert pavement landscape 0.6 miles south of the Mojave River. Vegetation includes creosote and some species of invasive grasses. Soils are characterized as light brown silty sand/sand. Throughout the desert pavement/sand dune landscape, there are naturally occurring bedrock outcrops, and eroded raw material cobbles and nodules that were deposited onto the landscape via the Mojave River.

P-36-005076 is characterized as a low-density lithic scatter typical of expedient raw material quarrying and early-stage lithic reduction. The most common artifacts found at these sites include primary and secondary flakes, shatter, and expediently utilized/assayed cobbles. Low-density lithic scatters of this type are common among the Mojave River Corridor. Typically, archaeological deposits of this nature are surficial and have low potential for buried cultural deposits. Table 6 provides a summary of artifacts observed on the surface of this site. The majority of artifacts and features associated with the historic-era/modern component of P-36-005076 are likely the result of rockhounding/informal recreational activities that occurred from the 1980s on, although there is some evidence (bi-metal cans) to indicate that this location was used as an historic-era dump site. Table 6 provides a summary of observed artifacts identified on the surface during site recordation as part of this inventory and evaluation effort.

Metal	Historic / modern	Can	2

6.1.3 LE-S-001

LE-S-001 is a prehistoric, low-density lithic scatter, located between P-36-005076 to the north, and P-36-003677 to the south. The site measures approximately 55 meters (N/S) by 60 meters (E/W) and consists of a single CCS unidirectional core, a diffuse scatter of CCS debitage (primary, secondary, interior flakes and shatter), as well as a single 5-meter concentration of red CCS debitage. There were no obvious hammerstones found in association with LE-S-001, nor was there any evidence of prehistoric domestic activity. Additionally, there were no formal artifacts, diagnostic artifacts, or temporal markers found in association with LE-S-001.

Disturbances include vehicle overland travel paths, modern human activity as evidenced by modern trash and debris, and rodent bioturbation. Erosional events and modern human activity have likely impacted the primary deposition and context of the material culture recorded at LE-S-001.

LE-S-001 is located within the Mojave River Corridor in the Mojave Desert, within a sand dune/desert pavement landscape 0.8 miles south of the Mojave River. Vegetation includes creosote and some species of invasive grasses. Soils are characterized as light brown silty sand/sand. Throughout the desert pavement and sand dune landscape, there are naturally occurring bedrock outcrops and eroded raw material cobbles and nodules deposited onto the landscape via the Mojave River.

The lithic assemblage at LE-S-001 is typical of expedient raw material quarrying and early-stage lithic reduction. The most common artifacts found at these sites include primary and secondary flakes, shatter, and expediently utilized/assayed cobbles. Low-density lithic scatters of this type are common among the Mojave River Corridor. Typically, archaeological deposits of this nature are surficial and have low potential for buried cultural deposits. In this case, the lithic scatter is located on deflated desert pavement in a depression between knolls, further emphasizing the surficial nature of the deposit. Table 7 provides a summary of observed artifacts identified on the surface during site recordation as part of this inventory and evaluation effort.

Table 7. Surface Artifact Inventory of LE-S-001

Artifact Type	Age	Description	Artifact Count
Flaked Stone	Prehistoric	CCS Unidirectional Core	1
Flaked Stone	Prehistoric	Red CCS Debitage (Concentration)	25+
Flaked Stone	Prehistoric	CCS Interior Flake	5
Flaked Stone	Prehistoric	CCS Secondary Flake	1
Flaked Stone	Prehistoric	CCS Primary Flake	5
Flaked Stone	Prehistoric	CCS Shatter	14

6.2 Buried Resource Potential and Project Site Integrity

The northern end of the Project area is approximately 700 m south of the current channel of the Mojave River; the western boundary is approximately 2,300 m east of the Mojave River, and due west of downtown Barstow. The river flows through a channel between the Mitchell Range to the north, and Daggett Ridge to the south; the Project area is at the northwestern terminus geological features that both abut and are transformed by the Daggett Ridge uplift. Here, relatively subtle outcrops of eroding volcanic, metavolcanic, and sedimentary strata interleave with riverine alluvium, and both fine and coarse grain sediments transported eastward from the perennially exposed Mojave Riverbed. These eroded bedrock exposures have attracted people to them for millennia, providing them with easy access to raw materials (rhyolitic and cryptocrystalline) for production of stone tools. Erosional processes have degraded the bedrock exposures differently in different places, but also made them accessible for quarrying. At the same time, redeposition of silt and sand has concealed lower elevation portions of the bedrock, and perhaps more recently, concealed the material evidence of the people who exploited these resources.

The paleontological resources inventory prepared by Dudek (Williams 2023) provides additional information regarding local and regional geology and the potential for encountering fossils of different geological eras. They note that because sediment deflation and shifting sands are common in areas of the Mojave Desert, recent alluvial and eolian deposits are sometimes underlain by Pleistocene paleosols (fossil soil horizons) at shallow depths. The bedrock exposed in the southeast portion of the Project area may be an example of this process. However, it is important to note that no Pleistocene paleosols have been observed anywhere within the Project area, and that observation of the fossil soil horizons they cite come from a completely different depositional basin approximately 6 miles to the northwest (Stewart and Hakel 2016). Furthermore, geotechnical borings up to 35.5 feet below ground surface reveal poorly graded sands and silty sands underlain by interbedded layers of lean clay, sandy silt, silty sand, poorly graded sands, and clayey sands, as well as a strongly cemented layer of coarse-grained soil at the depths where the borings were terminated (Villegas and Andersen 2022). No definitive fossil soil horizons were reported, and the nature of the interbedded units revealed through geotechnical boring points to processes of eolian erosion, redeposition, and post-depositional weathering expected of an arid environment downwind of an alluvial drainage.

Soils in the area are mapped as Dune Land and Victorville Sandy Loam in the north; Joshua Loam and Victorville Sandy Loam are present in the central portion of the site; and Rock Outcrop areas are mapped in the southern and northern areas of the Project area (SoilWeb 2023). This is generally consistent with conditions observed during Dudek's archaeological survey. The level of disturbance throughout the Project area, coupled with the limited number of diagnostic artifacts, makes it difficult to assign specific temporal attributes to the historic-era/modern elements of the observed resources. As noted above, P-36-003677 and P-36-005076 were surveyed in 1979 and

1981; these studies did not identify substantial disturbances outside of off-highway vehicle (OHV) activity, nor were any historic-era artifacts or features observed. Subsequent to these surveys, the development of the community to the south of the Project area occurred. A cursory site visit was conducted in 2006; the area was observed to have been substantially disturbed. This period of disturbance is generally supported by review of the historical maps and imagery, as previously discussed in detail above. Given the absence of possible mining/excavation pits or other features reported in the 1979 and 1981 reports, it can be reasonably concluded that the majority of these elements that are observable within P-36-003677 and P-36-005076 post-date these studies and are, therefore, modern or near-modern in age. Given the easy accessibility and high quality of the lithic source, the beauty of the CCS and jasper materials, and the popularity of the Barstow area for "rockhounding", it is very likely that a good deal of the excavated soils and other disturbances to the area were caused by geologic hobbyists seeking and removing rock samples.

Areas to the north and the south associated with Dune Land have a higher potential for buried deposits. In addition, both areas are associated with higher relative densities of archaeological resources. By contrast, the center of the Project area where limited prehistoric or historic era materials were encountered, is relatively low potential for buried resources. This area appears to have been subject to a high degree of previous disturbance.

In general, artifact complexity, variability, and frequency are relatively low within the archaeological resources documented in the Project. While buried resource potential is possible in the areas discussed above, information gathered from surface evidence has provided an understanding of the range and frequency of artifacts associated with these resources. The likelihood for substantially different archaeological assemblages and/or deposits, or significant features, to be present in subsurface contexts is unlikely.

6.2.1 Sub-Surface Archaeological Testing

To evaluate the likelihood of buried cultural deposits further, two Dudek archaeologists (Jessica Colston and Patrick Hadel) accompanied by one representative from the Yuhaaviatam of San Manuel Nation (Kristen Tuosto) conducted a single day of sub-surface archaeological testing on March 4, 2025. The effort was conducted in accordance with the details provided in the *Lenwood EV Truck Charging Station – Cultural Resources Sub-Surface Testing Plan* (Barton 2025a – Appendix E) which was reviewed and approved by San Bernardino County and Consulting Tribes. This Testing Plan called for 6 sub-surface investigations, all of the same type (i.e., 50 x 50-centimeter Shovel Test Pits [STP], to a maximum likely depth of 60 centimeters below surface). All 6 STPs were to be placed in approximately the same area: the northeast portion of the Project site where wind-blown sediments accumulate in a dune complex and may bury (and therefore obscure) cultural resources that might otherwise be visible on the surface. The location of each STP was determined based on field conditions and discussions between the Dudek archaeologists and the representative from the Yuhaaviatam of San Manuel Nation.

Complete details of this one-day testing effort are provided in the *Memorandum: Electric Vehicle Charging Station and Logistics Facility Project – Cultural Resources Sub-Surface Testing Results* (Barton 2025b – Confidential Appendix F), which was also reviewed and approved by San Bernardino County and Consulting Tribes. What follows is a summary. No hearths, items indicative of domestic activities, funerary items, or in-tact cultural strata were observed in any of the STPs. The only STP with any cultural material was excavated to a relatively shallow depth (18 cmbs) where bedrock was encountered. This is likely indicative of deflation, where artifacts deposited on the surface of the dunes have migrated downwards as smaller sediments are transported away by wind, leaving cultural materials concentrated near an impervious, stable surface. The absence of in-tact cultural stratigraphy and a rich and/or diverse artifact assemblage in any of the STPs indicates that the potential for substantial or otherwise

complex buried cultural deposits that could contribute to California Register of Historical Resources eligibility is low in the dune complex. Present management recommendation, including implementation of archaeological and Native American monitoring and inadvertent discovery protocols, are considered to remain applicable and appropriate.

6.2.2 Geotechnical Fault-Slip Trenching

Two geotechnical testing trenches were excavated by Dudek heavy equipment operator Kevin DiSabatino between July 21 and July 24, 2025, in support of Terracon's geological exploration of geological fault rupture hazards (Terracon 2025). The two trenches were located in the southeastern portion of the Project site. The "West Trench" was approximately 320 feet long and approximately 7 feet deep with benched side walls sides halfway through for safety. This made the overall excavation approximately 10 feet wide. The "East Trench" was approximately 120 feet long and 10 feet wide. The East Trench also had a crook in the alignment to the east at the northern end. Stations were marked by the Terracon Geologist at 10-foot increments along the length of the trenches.

To further examine the potential for buried cultural resources, Dudek archaeologist Jessica Colston inspected both trenches on July 22 and July 24, 2025. Jesse Gonzales was present both days for Tribal Monitoring on behalf of the Yuhaaviatam of San Manuel Nation.

The surface stratum (Stratum 1) was surficial sandy loam and generally was observed from surface to a depth of 2 feet in the area of the trenches. Stratum 2 (the Barstow Formation) is a laminated sandstone and siltstone stratum angled at approximately 30-degrees of uplift. This formation is well cemented and sorted. Stratum 3 is a pale grey sandstone, very well sorted with few gravels or inclusions.

The West Trench and East Trench both reveal a large angular unconformity, Unconformity A, trending East/West, perpendicular to the roughly north/south alignment of the trenches. Unconformity A consists of massive well-sorted reddish-brown silty sand with caliche (calcium carbonate) inclusions. It appears to have scoured the surface exposure of Stratum 2, as well as Stratum 3, as shown in Figures 5, 6 and 7. The presence of caliche in Unconformity A indicates stability of the landform for several thousand years. While Stratum 1 is the only stratum that has not begun to undergo lithification it has been subject to pedogenesis (i.e. the process of soil formation).

In the area of the geotechnical trenching (the southeastern portion of the Project site) the potential for sub-surface cultural resources is low because the depth of the friable soil and sand above bedrock is shallow and the alluvial sediments are of considerable antiquity (deposited upwards of 100,000 – 15,000 years ago; see Terracon 2025). By contrast, the wind-blown dune sands (in the northwest portion of the Project site) are much younger, mobile, and capable of burying cultural resources formerly located on or near the surface. However, sub-surface archaeological testing in the northwest portion of the site (see Section 6.2.1) did not reveal significant buried cultural resources, and did not produce any other evidence (geomorphic or anthropomorphic) that would indicate high potential for buried cultural resources.

7 Summary and Mitigation Measures

Dudek conducted a cultural resources inventory and evaluation-level cultural resources investigation for the proposed Project. The SCCIC records search identified two previously recorded cultural resources that intersect the Project area. These include two prehistoric lithic quarries/lithic scatters (P-36-003677 and P-36-005076). A search of the NAHC SLF did not identify any previously recorded Native American cultural resources within the Project area or within a one-mile buffer of the Project area. Additionally, a review of historic topographic maps and aerial imagery indicate that the Project area has remain undeveloped since at least 1952.

Dudek conducted a cultural resources pedestrian survey of the Project area and successfully re-identified both previously recorded cultural resources (P-36-003677 and P-36-005076) and recorded seven newly identified cultural resources. These newly identified cultural resources include a prehistoric lithic scatter (LE-S-001), three prehistoric lithic isolates (LE-I-002, LE-I-004, and LE-I-005), and three historic-era isolates (LE-I-001, LE-I-003, and LE-I-006). Isolates are categorically ineligible for listing on the CRHR and not considered unique archaeological resources under CEQA. Post-survey sub-surface archaeological testing was also conducted beyond the western boundary of site P-36-005076 at the request of Yuhaaviatam of San Manuel Nation, and excavation of two long deep trenches for geotechnical investigation were monitored for cultural resources. No significant cultural resources were recorded in these sub-surface inspections and the geomorphology in those areas indicate that the potential for significant buried cultural resources is minimal.

As noted previously, the Project area is near the reported location of the ethnohistoric Serrano settlements of *Tutupeat* and *Sisugenat*, (Sutton 2017). This was also the traditional territory of the *Yohaviatum* (also referred to as the Yuhaaviatam). Engagement with traditionally culturally affiliated Native American Tribes has been initiated. Please note that Tribal Cultural Resources represent an independent, albeit often related, resource type under CEQA. San Bernardino County has provided notification of the Project pursuant to AB 52 The Yuhaaviatam of San Manuel Nation and the Morongo Band of Mission Indians responded to the notification and received the prior version of this Cultural Resources Inventory to review.

7.1 Thresholds of Significance

The significance criteria used to evaluate a project's impacts to cultural resources under CEQA are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to cultural resources would occur if the project would:

a. Cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5.
b. Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5.
c. Disturb any human remains, including those interred outside of dedicated cemeteries.

7.2 Evaluation and Impacts Analysis

Threshold a. **Would the project cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?**

No historic era non-archaeological built-environment resources (presently used or standing buildings, structures, or features that are 45 years of age or older) are present within the Project area. Archaeological resources are addressed independently below.

Threshold b. **Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?**

Archaeological inventory efforts indicate that three prehistoric sites fall within the Project area. Two of these were previously recorded (P-36,003677 and P-36-005076) and one was newly identified through recent Dudek surveys (LE-S-001). A substantial level of near-modern and modern disturbance has occurred to these resources, including refuse dumping, OHV activity, and illicit excavation and collection of cultural and natural materials. In addition, six newly recorded isolates (three prehistoric and three historic-era) were identified. Site descriptions and results of the archaeological evaluation of the three recorded cultural resources (P-36-005076, P-36-003677 and LE-S-001) located within the Project area are presented below (Table 8).

Table 8. Cultural Resources Evaluation Results

Primary Number/Trinomial	Age	Description	Eligibility Recommendation
P-36-003677 (CA-SBR-003677/H)	Multicomponent	Lithic Quarry, Lithic Scatter, and Near-Modern/Modern Era Refuse Scatter	Ineligible for CRHR listing
P-36-005076 (CA-SBR-005076/H)	Multicomponent	Lithic Quarry, Lithic Scatter and Near-Modern/Modern Era Refuse Scatter	Ineligible for CRHR listing
LE-S-001	Prehistoric	Lithic Scatter	Ineligible for CRHR listing

Two previously recorded archaeological sites intersect the Project area: P-36-005076 and P-36-003677 (in the northeastern and southeastern sectors of the project area, respectively). One additional small prehistoric lithic scatter, LE-S-001, was recorded by Dudek near the center of the Project area. Both previously recorded resources have been characterized previously as prehistoric lithic quarries/lithic scatters. Following conventional practices when these resources were initially recorded, resource boundary delineation appears to have been defined by landform topography (including bedrock outcrops) rather than by the distribution of cultural material. Dudek surveys largely confirmed previous descriptions of these sites. The southern site contains visible bedrock, with discrete concentrations of lithic debris while the northern site is more of an amalgam of bedrock-derived cobbles, intermixed with sand, and occasional cultural material. The southeastern-most portion of the Project area (at P-36-003677) contains a concentration of material comprising of approximately 80 artifacts per 1,500 sq meters, while a similar size area in the northern site (P-36-005076) contains only a dozen. Part of this may be that cultural materials in the southern site rest on exposed bedrock and are therefore more visible than they might be in the northern site (which is an aggregate of erosion and deposition); it may also be that it was simply easier to locate raw materials on the exposed bedrock of the southern site in the past. In all cases, where sand dunes accumulate at the base of the landforms, artifacts are sparse, and may be concealed by soil deposition caused by dune mobility.

Cultural materials at both sites are typical of low-density, expedient raw material quarrying and early-stage lithic reduction. The most common artifacts are primary and secondary debitage, and shatter. Some amorphous cores with little to no preparation are also present; most seem to be assayed cobbles. Only three potential formed tools were recorded (a fragment of a bifacially-edged implement; and two early stage, broken, bifacially worked cores). Dudek did not locate any obvious hammerstones, and there was no evidence for domestic activity (e.g. butchering tools, groundstone, ceramics, shell ornaments, etc.).

While P-36-003677, P-36-005076, and LE-S-001 provide information pertaining to raw material acquisition and may have some antiquity (on the basis of visible differences in patination across different pieces of debitage), they represent a common resource type. There are substantially larger and more complex archaeological resources of this type nearby in the broader region. The artifact assemblages visible on the surface of these archaeological resources are of low frequency, density, and variability. While geomorphic characteristics of the area do support the potential for buried resources, any such buried deposit would very likely reflect the same patterns and assemblages observable on the surface. Sub-surface testing and monitoring of geotechnical trenching confirms this (see Section 6.2 and Confidential Appendix F). In addition, the Project area has been substantially disturbed through OHV activity and illicit excavation and collection. This issue of integrity further affects the potential for these documented archaeological resources to convey their significance as archaeological resources under CEQA.

Based on observed information, P-36-003677, P-36-005076, and LE-S-001 do not appear to be associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States (Criterion 1); the sites are not associated with the lives of persons important to the local area, California, or the nation (Criterion 2); and the sites do not embody the distinctive characteristics of a type, period, region, or method of construction, or represent the work of a master, or possess high artistic values (Criterion 3). Additionally, these resources do not appear to yield, or have potential to yield, information important to the prehistory or history of the local area, California, or the nation (Criterion 4). Therefore, P-36-003677, P-36-005076, and LE-S-001 are recommended as not eligible for listing in the CRHR. Furthermore, as a common resource type, these resources do not meet the criteria for a "unique archaeological resource" under Public Resources Code § 21083.2. These resources are not significant under CEQA and local regulations.

While no significant cultural resources have been identified within the Project Area, the presence of cultural material, noted above, and the geomorphic context indicate that Project activities have the potential to result in the discovery of previously unidentified resources. With implementation of implementation of **Mitigation Measure (MM) CUL-1, MM-CUL-2,** and **MM-CUL-3,** impacts to archaeological resources would be less than significant.

Threshold c. Would the project disturb any human remains, including those interred outside of dedicated cemeteries?

Human remains and associated grave goods are protected under California law. The SCCIC records search did not identify any archaeological resources with reported human remains that have potential to be impacted by the Project. Additionally, no human remains were observed within the Project area during the Dudek archaeological survey, sub-surface archaeological testing, or geotechnical trenching. Nevertheless, given the sensitivity of the area, the potential for accidental discovery remains, and would be potentially significant. Archaeological and Native American monitoring is recommended for all initial ground disturbing activities in and around known cultural resources within the Project area (see MM-CUL-3). Specific strategies for implementation of this program will be included in the Cultural Resources Management Plan (CRMP), which is to be reviewed by the lead agency and consulting tribes and finalized prior to construction (see MM-CUL-1). This plan will provide specific requirements for

the treatment of human remains, should they be encountered (as further described in MM-CUL-2). With implementation of **MM-CUL-1, MM-CUL-2,** and **MM-CUL-3,** impacts to human remains would be less than significant.

7.3 Mitigation Measures

By implementing the following list of recommended measures (RM), impacts to archaeological resources and human remains would be less than significant.

MM-CUL-1 **Cultural Resource Management Plan (CRMP):** To mitigate impacts to known archaeological resources, as well as those resources that may be encountered inadvertently during construction-related activities, a CRMP shall be developed. The CRMP shall be reviewed and approved by San Bernardino County, acting as lead agency, prior to issuance of grading permits. It shall be subject to review and input from Consulting Tribes (i.e., the Yuhaaviatam of San Manuel Nation and the Morongo Band of Mission Indians). The CRMP shall, at a minimum, include and expand upon the following components:

- Should design refinements result in possible impacts to other prehistoric sites, located outside of the current project parcel limits, management strategies shall be developed on a case-by-case basis (e.g., establishment of construction buffers) and will be subject to review and approval by the lead agency.
- The CRMP shall outline specific methods for ground disturbance during construction. Areas within dune complexes shall be subject to "controlled grading," where soil will be excavated or otherwise removed in shallow intervals from the surface and/or other appropriate methods such that subsurface conditions can be observed and sampled throughout initial disturbance by construction.
- The CRMP shall require that a Worker Environmental Awareness Program (WEAP) addressing cultural resources and Tribal Cultural Resources be developed by a Secretary of the Interior (SOI)-qualified archaeologist. The WEAP shall be implemented through on-site training of construction staff by a qualified archaeologist. Tribal representatives from Consulting Tribes shall be invited to attend and/or participate in the WEAP training should they elect to and will be given ten days' notice prior to the training. The WEAP shall include a description of the types of cultural material that may be encountered, cultural sensitivity issues, regulatory issues, and the proper protocol for treatment of the materials in the event of a find.
- To the extent construction activities uncover previously unknown or additional potentially significant components of known cultural resources, all such activities shall stop in the vicinity of the resource until the significance of the resource(s) is determined. An appropriate buffer for avoidance during construction is typically 60 feet, which may be adjusted at the recommendation of a qualified archaeologist meeting SOI qualifications, so that the exclusion buffer allows key areas of construction to proceed while ensuring that no ongoing project activities will affect the find. The CRMP shall provide for archaeological evaluation to occur, as approved by San Bernardino County, and in consultation with Consulting Tribes. While the archaeologist is engaged with the find, work outside of the buffer may only continue with the presence of an additional archaeologist to monitor the work. Resources shall be evaluated by a qualified archaeologist through an archaeological testing phase that consists of systematic excavations of a sample of areas within the Project area to determine the integrity

of the archaeological deposits, the horizontal and vertical extent of the deposits, and the quantity and diversity of artifacts contained within the deposits. The Project proponent may use the information from the testing phase as described in the resulting report to refine or revise the Project impact area for purposes of avoidance. The goal is to avoid, if feasible, or minimize impacts to significant deposits based on the results of the test excavations. The qualified archaeologist shall assess if the archaeological site qualifies as a significant or unique archaeological resource under the criteria of the California Environmental Quality Act (CEQA) Guidelines Section 15064.5, or a Tribal Cultural Resource under the criteria of Public Resources Code Section 21074, in consultation with San Bernardino County, and Consulting Tribes. For purposes of this mitigation measure, feasibility of avoidance shall be determined by San Bernardino County based on the recommendation of the Project proponent, in consultation with Consulting Tribes. If avoidance is not feasible, preservation in place, if feasible, is the preferred manner of mitigating impacts to archaeological resources pursuant to CEQA Guidelines Section 15126.4(b)(3)(A). However, Section 15126.4(b)(3)(C) also recognizes that data recovery through excavation may be the only feasible mitigation for significant or unique cultural resources at times; therefore, this contingency should be provided for as well in the CRMP.

- Regarding Tribal Cultural Resources, where avoidance or preservation in place are not feasible, the preferred treatment is for Tribal Cultural Resources to be reburied as close to the original find location as possible. However, should reburial within/near the original find location during project implementation not be feasible, then another reburial location should be identified on-site, if feasible, by the Project proponent in consultation with Consulting Tribes and approved San Bernardino County. Reburial should not occur until all ground-disturbing activities associated with the project have been completed, all monitoring has ceased, and all cataloguing and basic recordation of cultural resources have been completed.
- Should it occur that avoidance, preservation in place, or on-site reburial are not feasible options for treatment of Tribal Cultural Resources, the landowner shall relinquish all ownership and rights to material suitable for curation and confer with Consulting Tribes to identify an American Association of Museums (AAM)-accredited facility within the County of San Bernardino that can accept the materials into their permanent collections and provide for the proper care of these objects in accordance with the 1993 CA Curation Guidelines. A curation agreement with an appropriate qualified repository shall be developed between the Project proponent and museum that legally and physically transfers the collections and associated records to the facility. This agreement shall stipulate the payment of fees necessary for permanent curation of the collections and associated records and the obligation of the Project proponent to pay for those fees.
- The CRMP shall define the requirements for inadvertent discoveries, communication and notification to San Bernardino County and consulting parties, daily monitoring log preparation, and the final construction monitoring report. The final monitoring report shall be submitted to the San Bernardino County, Consulting Tribes, and the South Central Coastal Information Center.

MM-CUL-2 **Treatment of Human Remains:** If human remains are found during evaluations, data recovery, construction monitoring, or any Project-related ground-disturbing activity, all work within 100 feet of the find shall cease and the San Bernardino County Coroner shall be notified within 24 hours.

The remains shall be treated with appropriate dignity pursuant to the requirements of California Public Resources Code Section 5097.98 and the California Environmental Quality Act Guidelines Section 15064.5(e). Project-specific requirements (e.g. stop work buffers, County Coroner contact information) shall be included in the Cultural Resource Management Plan.

MM-CUL-3 **Construction Monitoring:** A qualified archaeologist shall monitor initial grading, subsurface disturbances, or other ground-disturbing activities on the Project site. If unanticipated cultural resources are encountered during construction, the process outlined by the Cultural Resource Management Plan (CRMP) shall be followed. General responsibilities of the archaeological monitor shall include monitoring construction, preparation of daily monitoring logs, reporting and assessing inadvertent discoveries, communication with on-site Native American monitors and contractors, guiding installation and tracking maintenance of environmentally sensitive area marking, and generally ensuring implementation of the CRMP and approved mitigation. The final Cultural Resources Monitoring Report shall act as a record of compliance with guiding documents and mitigation.

Re: EVC Truck Stop Project Dudek No. 15054 Project, San Bernardino County

Dear Ms. Colston:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Cameron.vela@nahc.ca.gov.

Sincerely,

Cameron Vela

Appendix E
Sub-surface Testing Plan

DUDEK
27271 LAS RAMBLAS, SUITE 340
MISSION VIEJO, CALIFORNIA 92691
T 949.450.2525

MEMORANDUM

To:	Jon Braginton, Land Use Services Department, San Bernardino County, California
From:	Loukas Barton, Dudek
Subject:	Lenwood EV Truck Charging Station – cultural resources sub-surface testing plan
Date:	February 5, 2025
cc:	Phil Angelides, Riverview Capital Investments Brian Vail, River West Investments Christine Kronenberg, Dudek
Attachment(s):	Figure 1 – Project Location

Pursuant to the requirements outlined by San Bernardino County following input from Consulting Tribes, Dudek will conduct limited-scope sub-surface testing for buried cultural resources within the Project Site but beyond the boundaries of known cultural resources. These sub-surface investigations will be conducted in areas where wind-blown sands may have covered cultural resources that might otherwise be visible on the surface. The purpose of this effort is to augment our understanding of sub-surface conditions as described previously in the revised Cultural Resources Inventory and Evaluation Report (Giacinto et al. 2024) submitted to San Bernardino County in October of 2024.

1 Background

The proposed Project is located on Lenwood Road between SR 58 and I-15, in the census-designated place of Lenwood, San Bernardino County, California. The Project falls within Section 8 of Township 9 North, and Range 2 West of the Barstow, California USGS 7.5-minute Quadrangle (Figure 1, Project Location) and encompasses 0497-142-03, 0497-142-04, 0497-142-14, and 0497-142-15 (Figure 2, Project Area).

The Project proponent proposes to develop the approximately 100-acre Project area into (1) an EV charging station to serve light duty/passenger vehicles and medium and heavy-duty trucks, and (2) a state-of-the-art concrete tilt-up logistics facility of 1,341,432 square feet in three buildings.

The proposed Project would also contain associated site improvements, including landscaping, parking, required utility facilities and upgrades, a drainage basin, and a buffer (e.g., landscaping, wall) at the project's southern boundary. Access to and from the Project area would be via Lenwood Road.

EV Charging Station

The proposed approximately 21-acre EV charging station would provide EV charging for light duty/passenger vehicles and medium and heavy-duty trucks.

The proposed EV charging station would provide a range of EV chargers to serve different charging needs (e.g., automobiles vs medium and heavy-duty trucks; slower chargers for overnight truck charging vs: MCS charging for trucks, etc.).

The EV charging station would also include a commercial building of up to 15,000 square feet that would contain ancillary uses (e.g., food, convenience services, showers for travelers, other amenities, etc.) for those utilizing the hub, as well as for local residents and nearby light industrial uses.

Logistics Facility

The remainder of the site, approximately 80-acres, would include a proposed logistics facility to meet the demand for highly functional, efficient logistics buildings that meet contemporary industry standards. The facility would consist of three buildings, each comprising 447,144 square feet, with a total square footage of 1,341,432.

2 Sub-Surface Testing Plan

Dudek will conduct a single day of sub-surface archaeological testing on the Project site. This will require two archaeologists travel from Encinitas to Barstow to complete the work. This task assumes that no more than 6 sub-surface investigations, all of the same type (i.e. 50 x 50-centimeter Shovel Test Pits, to a maximum likely depth of 60 centimeters below surface), and all placed in approximately the same area (the northeast portion of the Project Site), will be required. This task also assumes that Native American tribes will be present for and contribute to all archaeological activities (and will cover the cost of doing so). Dudek will provide notification of the field work schedule to Consulting Tribes ten days in advance.

Shovel Test Pits

STPs, measuring 50 × 50-centimeters, are intended to provide for a general understanding of the subsurface conditions throughout the investigated area. STPs may be excavated in 10-centimeter or 20-centimeter arbitrary levels, depending on subsurface conditions, with shallow intervals being more appropriate where archaeological material may be encountered and greater volumetric control is required. Relatively accurate vertical provenience is allowed by STPs. This type of sub-surface inspection also provides for a larger sample when looking for buried cultural deposits and allows for direct inspection of subsurface soil profiles along their exposed side walls. STPs are often used to delineate boundaries of previously unknown sites or components. STP forms will be completed for each STP with artifacts yielded, soil information, depth of excavation, level of disturbance, and other pertinent information required by standard practice. The maximum depth will be determined by 1) the ability to excavate and extract subsurface soils with hand-tools (i.e., rocky and/or compact, indurated soils may not allow for deeper excavations); and 2) the collapse of side-walls in loose, dry, sandy soil. We anticipate the average likely depth of STPs to be approximately 60 centimeters below surface.

Screening

The preferred strategy for all excavated matrix is to be screened through 1/8-inch (3-millimeter) wire mesh. Screens will be positioned over a tarp or plastic sheeting to collect the soil for later backfilling of the STPs. Sidewall profiles from STPs will be photographed where appropriate. In-field soil samples will be used for color and constituent

classification by depth. Optimally soils will be relatively dry, which provides for easier vertical control during excavation, quicker screening, and more accurate observation of relative hue and texture of soils.

3 Inadvertent Discoveries

Recovered artifacts will be documented and buried in the context from which they were found. Any potential human remains, including those of Native American origin and/or potential related grave goods, will be treated in compliance with applicable codes and regulations, specifically Section 7050.5 of the California Health and Safety Code as well as CEQA Guidelines Section 15064.5. Regulatory guidance concerning requirements for confidentiality and consequences of violating State laws and regulations will be appropriately considered and implemented.

4 Post-Field Summary

Dudek will prepare a brief written Memorandum that describes the results of the sub-surface investigations for review by the Client, Consulting Tribes, and San Bernardino County. This Memorandum will generate a record of findings that contains the following: a summary of testing efforts; a table with subsurface soil descriptions; an archaeological assessment of cultural resource sensitivity in the area inspected; and a map documenting the findings. Further management recommendations/refinements will be provided, as needed based on the results of the testing efforts. Dudek assumes that review of this Memorandum of Results will require no more than one round of review/revision.

Dear Mr. Vail:

This report presents the findings of a preliminary geotechnical engineering investigation for the subject property. This report does not include geotechnical engineering design level recommendations for development of the site; rather it is intended to identify geotechnical engineering conditions which may present significant impacts to future site development. A project specific geotechnical engineering investigation will need to be prepared prior to design and construction when the locations and details of the proposed improvements are known.

We appreciate the opportunity to be of service to EVC Partners, LLC. If you have any questions regarding this report, or if we can be of further assistance, please contact us at your convenience at (800) 268-7021.

Sincerely,

MOORE TWINING ASSOCIATES, INC.

1.0 INTRODUCTION

This report presents the findings of a preliminary geotechnical engineering investigation for the subject property.

The contents of this report include the purpose of the investigation and the scope of services provided. The background information, a description of the investigative procedures used and the subsequent findings are presented. Finally, the report provides general conclusions and preliminary recommendations. The appendices contain the drawings (Appendix A), the logs of test borings (Appendix B), and the results of laboratory tests (Appendix C).

The Geotechnical Engineering Division of Moore Twining, headquartered in Fresno, California, performed the investigation.

2.0 PURPOSE AND SCOPE OF PRELIMINARY INVESTIGATION

2.1 Purpose: The purpose of the investigation was to conduct a field exploration and a laboratory testing program, evaluate the data collected during the field and laboratory portions of the investigation, and provide the following:

2.1.1 A general description of the subsurface soil and groundwater conditions encountered;

2.1.2 Discussion of geotechnical engineering conditions identified during the preliminary investigation which may present significant impacts to site development;

2.1.3 Assessment of potential geotechnical engineering constraints such as expansive soils, liquefaction and seismic settlement, and compressible soils;

2.1.4 Discussion of foundation types and general foundation design parameters;

2.1.5 Seismic design coefficients based on the 2019 California Building Code (CBC);

2.1.6 Discussion of soil corrosivity; and

2.1.7 Final test boring logs, and laboratory test results.

This preliminary investigation did not include a design level geotechnical engineering investigation, a geologic/seismic hazards evaluation, flood plain investigation, compaction tests, environmental investigation, or environmental audit. A design level geotechnical engineering investigation will need to be conducted for use in design and construction of the project.

This preliminary geotechnical engineering investigation report is provided specifically for the proposed project described in the Site Location and Description section of this report. It is not the intent of this investigation to meet the requirements of the 2019 California Building Code (CBC), as related to geotechnical studies. Rather this report is intended to identify geotechnical engineering conditions which may present significant impacts to future to site development. This investigation did not include compaction tests, environmental investigation, or environmental audit.

2.2 **Scope:** Our proposal, dated May 31, 2022, outlined the scope of our services. The actions undertaken during the investigation are summarized as follows.

2.2.1 An aerial image showing the approximate limit of the project site, undated, provided by EVC Partners, LLC, was reviewed to understand the limits of the site.

2.2.2 A report, entitled: "Phase I Environmental Site Assessment Proposed Land Development, Southeast Corner of Lenwood Road and Agate Road, Barstow, California 92311, dated June 15, 2022, prepared by our firm, was reviewed for general background information.

2.2.3 The proposed test boring locations were marked and Underground Service Alert was contacted to mark member utilities in the immediate vicinity of the boring locations (if any).

2.2.4 Mr. Brian Vail (EVC Partners, LLC) was consulted during the investigation.

2.2.5 A visual site reconnaissance and subsurface exploration were conducted.

2.2.6 Aerial images of the site for eleven (11) individual years from 1959 to 2016, were reviewed.

2.2.7 Topographic images of the site for nine (9) individual years from 1932 to 2018, were reviewed.

2.2.8 Laboratory tests were conducted to determine selected physical and engineering properties of the subsurface soils encountered.

2.2.9 The data obtained from the investigation were evaluated to develop an understanding of the subsurface soil conditions and the engineering properties of the subsurface soils encountered.

2.2.10 This report was prepared to present the purpose and scope, background information, field exploration procedures, findings, and conclusions and preliminary recommendations.

3.0 PROJECT DESCRIPTION

The site location and description, site history, previous studies, and the anticipated construction are summarized in the following subsections.

3.1 Site Location and Description: The project site is generally located southeast of the intersection of Lenwood Road and Agate Road in the Barstow area of Kern County, California. The site has been assigned the following Assessor's Parcel Numbers (APNs): 0497-142-03, -04, -14, and -15. The approximate location of the site is shown on Drawing No. 1 in Appendix A of this report.

The site is roughly rectangular in shape and covers roughly 96 acres. The site is bounded by Lenwood Road to the east, by vacant land and residential developed properties to the north with Agate Road beyond, by a residential subdivision to the south, and by vacant land to the east.

The site consists of rolling terrain generally ranging from about 2,270 feet above mea sea level (AMSL) near the southeast corner of the site to about 2,194 feet AMSL near the northern portion of the site. Several small and shallow washes were noted through out the site. At the time of our investigation, the site was covered with scattered seasonal vegetation consisting of grasses, weeds, and scattered shrubs. Dirt roads or paths that appeared to be used by offroad vehicles were noted through out the site, including a path along the western side of the site parallel to Lenwood Road. Loose, sandy soils were noted at the ground surface. This condition made most of the site impassable to heavy two-wheel trucks. Fine to coarse gravel fragments were noted to be scattered across the ground surface.

Buried fiber optic warning markers were observed along the western boundary of the project site trending from south to north.

3.2 Site History: Based on review of historical satellite images of the site dating from 1959 to 2021, the conditions of the site have not changed significantly from 1959 to those described at the time of our field investigation conducted in June of 2022.

3.3 Previous Studies: The afore-referenced report entitled: "*Phase I Environmental Site Assessment, Proposed Land Development, Southeast of Lenwood Road and Agate Road, Barstow, California 92311"* prepared by our firm, was reviewed for general background information.

No previous geotechnical engineering reports or geological studies conducted for this site were provided for our review. If these documents are available they should be provided to Moore Twining for review.

3.4 Anticipated Construction: Based on our understanding, a new electric charging truck station with a travel center is being planned at the site. A site plan was not available at the time this report was prepared. However, based on our discussions with Mr. Brian Vail (EVC Partners, LLC), Mr. Vail indicated the site would be similar to the travel center development located at 100 Marguerite Street in Williams, California. Thus, the future development plans are anticipated to include a fueling canopy and areas for charging electric vehicles. A travel shop, truck care building and possibly a restaurant building may also be planned based on our review of the existing improvements at the travel center in Williams, California. Based on the rolling terrain, cuts and fills on the order of 5 to 10 feet may be required to establish design grades for the project.

4.0 FIELD INVESTIGATION

On June 30, 2022, Four (4) test borings were drilled at the subject site to depths of about 20 to 35½ feet below site grade (BSG) using a truck-mounted CME-75 drill rig equipped with 6-5/8 inch outside diameter (O.D.) hollow stem augers. Due to access constraints from the loose sandy surface soils, the drill rig borings were limited to the western portion of the site along an existing dirt access road. Additionally, one (1) exploratory boring was conducted using a hand-auger to an approximate depth of 3 feet BSG in the eastern portion of the site.

The borings were logged during drilling by a Moore Twining staff engineer. The borings were drilled at the approximate locations shown on Drawing No. 2 in Appendix A of this report. Logs of the borings are included in Appendix B of this report.

Standard penetration tests were conducted in the test borings, and both disturbed and relatively undisturbed soil samples were obtained. The standard penetration resistance, N-value, is defined as the number of blows required to drive a standard split barrel sampler into the soil. The standard split barrel sampler has a 2-inch O.D. and a 1⅜-inch inside diameter (I.D.). The sampler is driven by a 140-pound weight free falling 30 inches. The sampler is lowered to the bottom of the bore hole and set by driving it an initial 6 inches. It is then driven an additional 12 inches and the number of blows required to advance the sampler the additional 12 inches is recorded as the N-value.

Relatively undisturbed soil samples for laboratory tests were obtained by pushing or driving a California modified split barrel ring sampler into the soil. The soil was retained in brass rings, 2.5 inches O.D. and 1-inch in height. The lower 6-inch portion of the samples were placed in close-

fitting, plastic, airtight containers which, in turn, were placed in cushioned boxes for transport to the laboratory. Soil samples obtained were taken to Moore Twining's laboratory for classification and testing.

5.0 FINDINGS AND RESULTS

The findings and results of the field exploration and laboratory testing are summarized in the following subsections.

5.1 Mapped Surficial Geologic and Soils Conditions: Based on our review of the Geologic Map of California, San Bernardino Sheet, State of California Department of Conservation, Compilation by Thomas H. Rogers, 1967, the majority of the project site area is indicated to be underlain by Nonmarine (continental) sedimentary rock deposits (Mc), described as sandstone, shale, conglomerate, and fanglomerate. The map indicates a portion of the western edge of the site to be underlain by alluvial deposits (Qa).

According to the Web Soil Survey by the U.S. Department of Agriculture Natural Resources Conservation Service, the near surface soils (the upper 5 feet) at the site consist of poorly graded sands with silt and silty clay soils.

5.2 Soil Profile: The near surface soils encountered in the borings drilled for this investigation included poorly graded sands and silty sands to depths of about 3½ to 10 feet BSG. The near surface sandy soils were underlain by interbedded layers of lean clay, sandy silt, silty sand, deeper poorly graded sands, and clayey sand to the maximum depth explored of about 35½ feet BSG. At a depth of about 35½ feet BSG, practical auger refusal was encountered in test boring B-2 due to a strongly cemented layer of coarse grained soil.

The near surface sandy soils encountered in the upper 3½ to 5 feet BSG were loose to medium dense. The underlying silts and clays were generally stiff to hard, with exception of a silt encountered at a depth of about 10 feet in Boring B-2, which was soft. The deeper granular soils (poorly graded sands, silty sands and clayey sands) were medium dense to very dense.

5.3 Chemical Tests: Chemical tests were performed on one (1) near surface sample of collected from depth of about 0 to 5 feet BSG. The results indicated pH values of 8.0; a minimum resistivity value of 2,700 ohm-centimeter; 0.0047 percent by weight concentration of sulfate; and 0.0076 percent by weight concentration of chloride.

5.4 Groundwater Conditions: Groundwater was not encountered in any of the test borings to the maximum depth explored of about 35½ feet BSG.

Historical ground water data from the Department of Water Resources indicates that a well located about 500 feet north of the site indicates that ground water has ranged from about 90 feet BSG in 1992 to about 82 feet BSG in 2020. A second well in the vicinity of the site indicated groundwater at a depth of 60 feet BSG in 1958.

It should be recognized, that groundwater elevations typically fluctuate with time, since they are dependent upon seasonal precipitation, irrigation, land use, and climatic conditions as well as other factors. Therefore, water level observations at the time of the field investigation may vary from those encountered both during the construction phase and the design life of the project. The evaluation of such factors was beyond the scope of this investigation and report.

5.5 Existing Surface and Subsurface Conditions: At the time of our field investigation, the surface conditions at the site consisted or rolling terrain with some relatively small seasonal washes/drainages. Based on review of online readily available topographic information and various topographic maps from 1932 to 2018, the southeast portion of the site is higher in elevation in comparison to the northern end by about 70 feet, with low and high spots in between.

Based on our observations, the site generally appears to consist of native terrain with the exception of dirt roads or trails which were observed throughout parts of the site. The soil disturbance resulting from the dirt paths through the site appears to be relatively shallow (about upper 12 inches or less). Coarse fragments of native rock (size of coarse gravel fragments) were noted at the surface in some areas, while loose, windblown sand deposits cover other areas of the site. In addition, scattered trash and scattered bushes were noted across the site. As part of the site preparation, loose surface soils, disturbed soils and artificial fills will need to be prepared and compacted to provide adequate support of the proposed improvements.

We understand that underground fiber optic communication lines trend from north to south along the west edge of the project site (possibly in a utility easement).

5.6 Expansive Soils: One of the potential geotechnical hazards evaluated at this site is the expansion potential of the near surface soils. Over time, expansive soils will experience cyclic drying and wetting as the dry and wet seasons pass. Expansive soils experience volumetric changes (shrink/swell) as the moisture content of the clayey soils fluctuate. These shrink/swell cycles can impact foundations and lightly loaded slabs-on-grade when not designed for the anticipated expansive soil pressures. Expansive soils cause more damage to structures, particularly light buildings and pavements, than any other natural hazard, including earthquakes and floods (Jones and Holtz, 1973). Expansion potential may not manifest itself until months or years after construction. The potential for damage to slabs-on-grade and foundations supported on expansive soils can be reduced by placing non-expansive fill underlying foundations and slabs-on-grade.

In evaluation of the potential for expansive soils at the site, expansion index testing was performed on one (1) sample of the near surface silty sand soils which are anticipated to be within the zone of influence of the planned improvements. The sample was collected from depths of 0 to 5 feet BSG. The samples were selected for testing based on field observations indicating relatively high fine grained content of the samples.

The expansion index testing was performed in accordance with ASTM D4829 and the results are included in Appendix C of this report. The result of laboratory testing revealed expansion index of 0, indicating very low expansion penitential for the near surface granular soils. However, clay soils with medium plasticity were encountered as shallow as 3½ feet in one of the borings. In addition, the U.S.D.A. soil survey data identifies surface clays within a part of the site. Accordingly, expansive clays should be anticipated within the site in some areas that would be encountered during grading for the site development. In general, where expansive soils are encountered, they should be capped with a sufficient thickness of granular fill. Further evaluation of expansive soils should be evaluated as part of design level investigations.

5.7 Foundation Support: Details of the proposed construction such as structure loads were not available at the time of preparation of this report. Based on the compressibility of the near surface soils and considering the cut and fill which is likely to be required to achieve the design site grades, shallow foundations supported on engineered fill is anticipated to be the most cost effective approach for design of the building structure(s) for the site. Considering the type of structures planned for the site, support of shallow foundations on engineered fill is considered feasible for this site. The depth of engineered fill required below foundations should be determined during the design level geotechnical investigation.

5.8 Active Faulting: An "active fault" is defined, for the purpose of this evaluation, as a fault that has had surface displacement within the Holocene Epoch (about the last 11,700 years). Potentially active faults also contribute to the seismicity of the site. A widely accepted definition of "potentially active" is a fault that does not show evidence of displacement during the Holocene, but shows evidence of displacement occurring less than 1.6 million years ago (after the beginning of the Pleistocene Epoch). Since the Quaternary Period includes the Holocene and Pleistocene Epochs, Quaternary Faults are those that have documented latest fault displacement within the Holocene or Pleistocene Epochs, undifferentiated. Faults showing evidence of displacement older than 1.6 million years are usually classified as "Pre-Quaternary" and "inactive." Pre-Quaternary faults do not impact the site seismicity.

Earthquakes are caused by the sudden displacement of earth along faults with a consequent release of stored strain energy. The fault slippage can often extend to the ground surface where it manifests in abrupt relative ground displacement across a rupture surface. Damage resulting directly from fault rupture ground displacement occurs only where structures are located astride a rupture surface with relative displacement. The project site is not located in an Alquist-Priolo Earthquake Fault Zone mapped by the California Geological Survey, nor a San Bernardino County designated fault zone

(based on the San Bernardino County Land Use Plan, Geologic Hazard Overlays). The locations of active faults were evaluated based on the Fault Activity Map of California: California Geological Survey, Geologic Data Map No. 6, prepared by Jennings and Bryant. The Fault Activity Map of California identifies an active, creeping segment of the Lenwood-Lockhart fault zone (Lenwood section) mapped just east of the southern portion of the site. The nearest active fault with traditional surface rupture is a section of the Lenwood-Lockhart fault zone further southeast of the site, about 2.1 miles from the site. A concealed, potentially active fault (Lockhart section) associated with the Lenwood-Lockhart fault zone is mapped about ¾ mile to the northwest. The approximate locations of these fault sections are shown on Drawing No. 3 in Appendix A. The nearby faults shown on the U.S. Quaternary Fault map prepared by the United States Geological Survey are similar to the Fault Activity Map of California. Based on the documents reviewed, since active faults are not mapped within the site, the potential for surface rupture due to a known active fault appears to be low. However, potential impacts from the adjacent Lenwood fault section are recommended to be evaluated if a future structure is planned within a hypothetical northwest extension of the fault section shown to the east of the site.

5.9 **Site Class and Seismic Ground Motion Parameters**: Based on the 2019 California Building Code (CBC), a Site Class D represents the on-site soil conditions with standard penetration resistance, N-values, ranging from 15 to 50 blows per foot in the upper 100 feet below site grade. Based on the results of our field investigation and the 2019 California Building Code (CBC), the site soils are represented by Site Class D. Maximum Considered Earthquake (geometric mean) peak ground acceleration adjusted for site effects (PGA_M) of 0.647g was determined for the site based on Site Class D, respectively, using the Ground Motion Parameter Calculator provided by the United States Geological Survey (https://seismicmaps.org/).

A table providing preliminary design acceleration parameters for the project site, based Site Class D, is included in this report.

5.10 **Liquefaction and Seismic Settlement** Liquefaction and seismic settlement are conditions that can occur under seismic shaking from earthquake events. Liquefaction describes a phenomenon in which a saturated, cohesionless soil loses strength during an earthquake as a result of induced shearing strains. Lateral and vertical movements of the soil mass, combined with loss of bearing usually results. Fine, well sorted, loose sand, shallow groundwater conditions, higher intensity earthquakes, and particularly long duration of ground shaking are the requisite conditions for liquefaction.

The site is not located in a liquefaction hazard area identified by San Bernardino County (San Bernardino County Land Use Plan, Geologic Hazard Overlay). Based on the depth to groundwater, liquefaction is not considered a potential impact to the site.

However, due to the presence of granular soils and the high seismicity of the site area, dry seismic settlement is a potential concern. Thsu, analyses of potential seismic settlement was conducted using the computer program LIQUEFYPRO by Civiltech. The results of hazard deaggregation analysis indicates a magnitude 7.45 earthquake event is a predominant earthquake magnitude contributing to the design seismic ground motion. As indicated in Section 5.8 of this report, a Maximum Considered Earthquake (geometric mean) peak horizontal ground acceleration of 0.604g was also used for the analysis.

The analysis considered the standard penetration test results (N-values) from the soil borings, wet unit weight, and fines content throughout the depths explored (see test boring logs, Appendix B).

The results indicate that seismic induced settlement of damp to dry sandy soils as a result of the design level seismic event (such as those encountered at the location of borings B-2 and B-3) is a potential. The results of the analyses indicate total seismic settlements would be about ¾ inch. This magnitude of seismic settlement is not typically considered a concern for the type of structures contemplated at the site.

5.11 Soil Corrosion: The risk of corrosion of construction materials relates to the potential for soil-induced chemical reaction. Corrosion is a naturally occurring process whereby the surface of a metallic structure is oxidized or reduced to a corrosion product such as iron oxide (i.e., rust). The metallic surface is attacked through the migration of ions and loses its original strength by the thinning of the member.

Soils make up a complex environment for potential metallic corrosion. The corrosion potential of a soil depends on numerous factors including soil resistivity, texture, acidity, field moisture and chemical concentrations. In order to evaluate the potential for corrosion of metallic objects in contact with the onsite soils, chemical testing of soil samples was performed by Moore Twining as part of this report. The test results are included in Appendix C of this report. Conclusions regarding the corrosion potential of the soils tested are included in the Conclusions and Recommendations section of this report based on the National Association of Corrosion Engineers (NACE) corrosion severity ratings listed in Table No. 1, below.

Table No. 1
National Association of Corrosion Engineers Corrosion Severity Ratings

Soil Resistivity (ohm cm)	Corrosion Potential Rating
>20,000	Essentially non-corrosive
10,000 - 20,000	Mildly corrosive
5,000 - 10,000	Moderately corrosive
3,000 - 5,000	Corrosive
1,000 - 3,000	Highly corrosive
<1,000	Extremely corrosive

The results of soil sample analyses indicate that the near-surface soils exhibit a "highly corrosive" corrosion potential to buried metal objects.

If the manufacturers or suppliers cannot determine if materials are compatible with the soil corrosion conditions, a professional consultant, i.e., a corrosion engineer, with experience in corrosion protection should be consulted to provide design parameters. Moore Twining does not provide corrosion engineering services.

5.12 Sulfate Attack of Concrete from Soils: Degradation of concrete in contact with soils due to sulfate attack involves complex physical and chemical processes. When sulfate attack occurs, these processes can reduce the durability of concrete by altering the chemical and microstructural nature of the cement paste. Sulfate attack is dependent on a variety of conditions including concrete quality, exposure to sulfates in soil, groundwater and environmental factors. The standard practice for geotechnical engineers in evaluation of the soils anticipated to be in contact with structural concrete is to perform laboratory testing to determine the concentrations of sulfates present in the soils. The test results are then compared with the exposure classes in Table 19.3.1.1 of ACI 318 to provide guidelines for concrete exposed to soils containing sulfates. It should be noted that other exposure conditions such as seawater or dissolved sulfates in water or materials other than soils can result in sulfate exposure categories to concrete that are higher than the concentrations of sulfate in soil. The design engineer will need to determine whether other potential sources of sulfate exposure need to be considered other than exposure to sulfates in soil. The sulfate exposure classes for soils from Table 19.3.1.1 are summarized in the below table.

Table No. 2
ACI Exposure Categories for Water Soluble Sulfate in Soils

Sulfate Exposure Class (per ACI 318)	Water Soluble Sulfate in Soil (Percent by Mass)
S0	Less than 0.10 Percent
S1	0.10 to Less than 0.20 Percent
S2	0.20 to Less than or Equal to 2.00 Percent
S3	Greater than 2.00 Percent

Common methods used to resist the potential for degradation of concrete due to sulfate attack from soils include, but are not limited to the use of sulfate-resisting cements, air-entrainment and reduced water to cement ratios. The laboratory test results are included in Appendix C of this report. Conclusions regarding the sulfate test results are included in the Conclusions section of this report.

6.0 CONCLUSIONS AND PRELIMINARY GEOTECHNICAL ENGINEERING RECOMMENDATIONS

Based on the findings of this preliminary investigation, the following preliminary conclusions and recommendations were identified.

6.1 Based on the findings of this investigation, the site is considered suitable for the proposed development from a geotechnical engineering standpoint. When a site plan is developed identifying the locations and type of structures planned for the project, this information should be provided to Moore Twining in order to develop a scope of work and estimate for a design level geotechnical investigation.

6.2 The near surface soils encountered in the borings drilled for this investigation included poorly graded sands and silty sands to depths of about 3½ to 10 feet BSG. The near surface sandy soils were underlain by interbedded layers of lean clay, sandy silt, silty sand, deeper poorly graded sands, and clayey sand to the maximum depth explored of about 35½ feet BSG. At a depth of about 35½ feet BSG, practical auger refusal was encountered in test boring B-2 due to a strongly cemented layer of coarse grained soil. Groundwater was not encountered throughout the maximum depth explored of 35½ feet BSG.

6.3 Hard, sandy lean clay was encountered at a depth of about 8½ feet BSG in Boring B-1 and Nonmarine sedimentary rock deposits (Mc) are mapped within the site. Increased excavation effort should be anticipated for excavations to be conducted in areas of hard or very dense conditions.

6.4 The result of laboratory testing indicate the near surface granular soils are suitable for use as fill below pavements and slabs on grade for the project. Relatively shallow clay soils with medium plasticity were encountered in one of the borings. Where expansive clays are encountered, these soils should be capped with granular fill to reduce the potential for excessive heave of overlying slabs on grade and other surface improvements.

6.5 Based on the findings of this investigation, the use of shallow foundations and slab-on-grade floors supported on engineered fill are considered feasible for the building structures planned for the project. Over-excavation of the near surface soils will be required to place engineered fill below building foundations in order to reduce the potential for excessive static settlement. Based on our experience with similar projects, a net allowable soil bearing pressure of about 2,000 to 2,500 pounds per square foot for dead-plus-live loads may be appropriate for design of spread foundations.

6.6 The following seismic factors were developed for the site using the Ground Motion Parameter Calculator provided by SEOAC and OSHPD (http://seismicmaps.org), based upon a site latitude of 34.89024300 degrees and a site longitude of -117.11429900 degrees. The data provided in Table No. 3 are based upon the procedures of Sections 1613.2.1 through 1613.2.4 of the 2019 California Building Code, ASCE 7-16 and Supplement No. 1 to ASCE 7-16. The data in Table No. 3 were not determined based upon a ground motion hazard analysis. If required, Moore Twining should be notified and requested to conduct the additional analysis, develop updated seismic factors for the project, and update the following values.

Table No. 3
Seismic Factors

Seismic Factor	2019 CBC Value
Site Class	D
Maximum Considered Earthquake (geometric mean) peak ground acceleration adjusted for site effects (PGA_M)	0.604
Mapped Maximum Considered Earthquake (geometric mean) peak ground acceleration, (PGA)	0.549
Spectral Response At Short Period (0.2 Second), Ss	1.248
Spectral Response At 1-Second Period, S_1	0.436
Site Coefficient (based on Spectral Response At Short Period), Fa	1.001
Site Coefficient (based on spectral response at 1-second period) Fv	see note
Maximum considered earthquake spectral response acceleration for short period, S_{MS}	1.249
Maximum considered earthquake spectral response acceleration at 1 second, S_{M1}	see note
Five percent damped design spectral response accelerations for short period, S_{DS}	0.833

Seismic Factor	2019 CBC Value
Five percent damped design spectral response accelerations at 1-second period, S_{D1}	see note

Note 1: Requires ground motion hazard analysis per ASCE Section 21.2 (ASCE 7-16, Section 11.4.8), unless the structural engineer determines that an exception of Section 11.4.8 of ASCE 7-16 is applicable for the project design.

6.7 Due to the groundwater depth, liquefaction is not considered a concern for the site. The results indicate that seismic induced settlement of damp to dry sandy soils as a result of the design level seismic event (such as those encountered at the location of borings B-2 and B-3) is a potential. The results of the analyses indicate total seismic settlements would be about ¾ inch. This magnitude of seismic settlement is not typically considered a concern for the type of structures contemplated at the site.

6.8 The Fault Activity Map of California identifies an active, creeping segment of the Lenwood-Lockhart fault zone (Lenwood section) mapped just east of the southern portion of the site. The nearest active fault with traditional surface rupture is a section of the Lenwood-Lockhart fault zone further southeast of the site, about 2.1 miles from the site. A concealed, potentially active fault (Lockhart section) associated with the Lenwood-Lockhart fault zone is mapped about ¾ mile to the northwest. The approximate locations of these fault sections are shown on Drawing No. 3 in Appendix A. Based on the documents reviewed, since active faults are not mapped within the site, the potential for surface rupture due to a known active fault appears to be low. However, potential impacts from the adjacent Lenwood fault section are recommended to be evaluated if a future structure is planned within a hypothetical northwesterly extension of this fault section which is shown east of the site.

6.9 Based on the resistivity values from testing, the National Association of Corrosion Engineers (NACE) corrosion severity ratings shown in Table No. 1, the soils exhibit a “highly corrosive” corrosion potential. Therefore, buried metal objects should be protected in accordance with the manufacturer's recommendations based on a “highly corrosive” corrosion potential. The evaluation was limited to the effects of soils to metal objects; corrosion due to other potential sources, such as stray currents and groundwater, was not evaluated. If piping or concrete are placed in contact with deeper soils or engineered fill, these soils should be analyzed to evaluate the corrosion potential of these soils. Additional laboratory testing should be performed during a design level geotechnical engineering investigation.

6.10 Based on the laboratory testing for soluble sulfates in soil, the results indicate an exposure category S0 in accordance with Table 19.3.1.1 of ACI 318, with a low potential for sulfate attack on concrete.

7.0 NOTIFICATION AND LIMITATIONS

7.1 The preliminary conclusions and recommendations presented in this report are based on the information provided regarding the proposed construction, and the results of the field and laboratory investigation, combined with interpolation of the subsurface conditions between boring locations.

7.2 This report does not include design level recommendations. These additional investigations will be required for to provide data for final geotechnical design.

7.3 The preliminary conclusions and recommendations contained in this report are valid only for the project discussed in the Background Information section of this report. The use of the information and recommendations contained in this report for structures on this site not discussed herein or for structures on other sites not discussed in this report is not recommended. The entity or entities that use or cause to use this report or any portion thereof for another structure or site not covered by this report shall hold Moore Twining, its officers and employees harmless from any and all claims and provide Moore Twining's defense in the event of a claim.

7.4 This report is issued with the understanding that it is the responsibility of the client to transmit the information and preliminary recommendations of this report to developers, owners, buyers, architects, engineers, designers, contractors, subcontractors, and other parties having interest in the project so that the steps necessary to carry out these recommendations in the design, construction and maintenance of the project are taken by the appropriate party.

7.5 This report presents the results of a preliminary geotechnical engineering investigation only and should not be construed as an environmental audit or study.

7.6 Our professional services were performed, our findings obtained, and our recommendations prepared in accordance with generally-accepted engineering principles and practices. This warranty is in lieu of all other warranties either expressed or implied.

7.7 Reliance on this report by a third party (i.e., that is not a party to our written agreement) is at the party's sole risk. If the project and/or site are purchased by another party, the purchaser must obtain written authorization and sign an agreement with Moore Twining in order to rely upon the information provided in this report for design or construction of the project.

8.0 CLOSING

Our professional services were performed, our findings obtained, and our recommendations prepared in accordance with generally-accepted engineering principles and practices. This warranty is in lieu of all other warranties either expressed or implied.

We appreciate the opportunity to be of service. If you have any questions regarding this report, or if we can be of further assistance, please contact us at your convenience.

Sincerely,
MOORE TWINING ASSOCIATES, INC.

APPENDIX B

LOGS OF BORINGS

This appendix contains the final logs of borings. These logs represent our interpretation of the contents of the field logs and the results of the field and laboratory tests.

The logs and related information depict subsurface conditions only at these locations and at the particular time designated on the logs. Soil conditions at other locations may differ from conditions occurring at these test boring locations. Also, the passage of time may result in changes in the soil conditions at these test boring locations.

In addition, an explanation of the abbreviations used in the preparation of the logs and a description of the Unified Soil Classification System are provided at the end of Appendix B.

KEY TO SYMBOLS

Symbol	Description
Strata symbols	
	Silty sand
	Silt
	Lean clay
	Poorly graded sand with silt
	Poorly graded sand
	Clayey sand
Misc. Symbols	
	Drill rejection

Symbol	Description
	Boring continues
Soil Samplers	
	Standard penetration test
	California Modified split barrel ring sampler
	Bulk/Grab sample

Notes:

1. Exploratory borings were drilled on June 30, 2022 using a CME 75 drill rig equipped with 6-5/8 inch outside diameter hollow stem augers.

2. Groundwater was not encountered.

3. Boring locations were measured or paced from existing features.

4. These logs are subject to the limitations, conclusions, and recommendations in this report.

5. The "N-Value" reported for the California Modified Split Barrel Sampler is the uncorrected field blow count. This value should not be interpreted as an SPT equivalent N-Value.

6. Results of tests conducted on samples recovered are reported on the logs.

DD =	Natural dry density (pcf)	LL =	Liquid Limit (%)
+4 =	Percent retained on #4 sieve (%)	PI =	Plasticity Index (%)
-200 =	Percent passing #200 sieve (%)	pH =	Soil pH
SS =	Soluble sulfates (%)	Cl =	Soluble chlorides (%)
SR =	Soil Resistivity (ohms-cm)	AMSL =	Above Mean Sea Level
ø =	Angle of Internal Friction (degrees)	c =	Cohesion (psf)
pcf =	pounds per cubic foot	O.D. =	Outside Diameter
N/A =	Not Applicable	N/E =	Not Encountered
EI =	Expansion Index		

APPENDIX C

RESULTS OF LABORATORY TESTS

This appendix contains the individual results of the following tests. The results of the moisture content and dry density tests are included on the test pit logs in Appendix B. These data, along with the field observations, were used to prepare the final test boring logs in Appendix B.

These Included:	To Determine:
Moisture Content (ASTM D2216)	Moisture contents representative of field conditions at the time the sample was taken.
Dry Density (ASTM D2937)	Dry unit weight of sample representative of in-situ or in-place undisturbed condition.
Grain-Size Distribution (ASTM D422)	Size and distribution of soil particles, i.e., sand, gravel and fines (silt and clay).
Atterberg Limits (ASTM D4318)	Determines the moisture contents where the soil behaves as a viscous material (liquid limit) and the moisture content at which the soil reaches a plastic state (plastic limit)
Consolidation (ASTM D2435)	The amount and rate at which a soil sample compresses when loaded, and the influence of saturation on its behavior.
Moisture-Density Relationship (ASTM D1557)	The optimum (best) moisture content for compacting soil and the maximum dry unit weight (density) for a given compactive effort.
Direct Shear (ASTM D3080)	Soil shearing strength under varying loads and/or moisture conditions.
R-Value (ASTM D2844)	The capacity of a subgrade or subbase to support a pavement section designed to carry a specified traffic load.
Expansion Index (ASTM D4829)	Swell potential of soil with increases in moisture content.
Resistivity (ASTM G187)	The potential of the soil to corrode metal.
Chloride Content (Cal Test 422)	Percentage of soluble chloride in soil. Used to evaluate the potential attack on encased reinforcing steel.
Sulfate Content (Cal Test 417)	Percentage of water-soluble sulfate as (SO4) in soil samples. Used as an indication of the relative degree of sulfate attack on concrete and for selecting the cement type.
pH (Cal Test 643)	The acidity or alkalinity of subgrade material.

RE: Electric Charging Station & Travel Center

Enclosed are the analytical results for samples received by our laboratory on **07/07/22** . For your reference, these analyses have been assigned laboratory work order number **IG07028**.

All analyses have been performed according to our laboratory's quality assurance program. All results are intended to be considered in their entirety, Moore Twining Associates, Inc. (MTA) is not responsible for use of less than complete reports. Results apply only to samples analyzed.

If you have any questions, please feel free to contact us at the number listed above.

Sincerely,

Moore Twining Associates, Inc.

Mr. Brian Vail
River West Investments, Inc.
2410 Fair Oaks Boulevard, Suite 110
Sacramento, CA 95825

Subject: Response to San Bernardino County Review
Proposed Electric Charging Truck Station with Travel Center
APNs 0497-142-(03, 04, 14, and 15)
Southeast of Lenwood Road and Agate Road
Barstow, San Bernardino County, California

References: San Bernardino County Land Use Services Geotechnical Report Review Sheet, dated May 23, 2024, prepared by San Bernardino County, Land Use Services Department, Geology Division

Preliminary Geotechnical Engineering Investigation, Proposed Electric Charging Truck Station with Travel Center, APNs 0497-142-(03, 04, 14, and 15), Southeast of Lenwood Road and Agate Road, Barstow, San Bernardino County, California, dated July 29, 2022, prepared by Moore Twining Associates, Inc., Project No. H07603.02

Dear Mr. Vail:

This letter has been prepared to respond to the comments included on the Geotechnical Report Review Sheet, dated May 23, 2024, prepared by San Bernardino County, Land Use Services Department, Geology Division (County). The County comments are restated below, followed by our responses.

Comment No. 1: Section 3.4 of the report describes the proposed development within the parcels, however, the plans provided as part of PROJ-2023-00108 do not match the described development within the Geotechnical Report. A revision to section 3.4 of the Geotechnical Report is required to match the proposed project PROJ-2023-00108.

Response: The referenced Preliminary Geotechnical Engineering Investigation report, dated July 29, 2022, was prepared before a site plan had been developed. Note that our referenced July 29, 2022 report is intended to evaluate the geotechnical engineering feasibility for the proposed site development and it not intended for design. The report indicates and that when the site plan is

PH: 559.268.7021
FX: 559.268.7126
2527 Fresno Street
Fresno, CA 93721

developed identifying the locations and type of structures planned for the project, this information should be provided to Moore Twining. It is our understanding that the current site plan is still somewhat preliminary relative to the locations of the improvements. However, the improvements that are shown on the various site plans recently provided (Preliminary Master Plan, dated April 10, 2024 and prepared by RMW Architecture Interiors), including the types of structures and site use, were reviewed and the referenced July 29, 2022 Preliminary Geotechnical Engineering Investigation report remains applicable for the intended purpose. Considering the precise location of each of the improvements have not been finalized, based on our discussions with Mr. Brian Vail with River West Investments, Inc., the design level geotechnical engineering investigation that is recommended in the July 29, 2022 report should be conducted pursuant to San Bernardino County standards prior to the approval of plans for the construction of any site improvements or structures within the area. When the design level geotechnical engineering investigation report is issued, the Anticipated Construction description in the report will be updated to reflect the improvements shown on the final site plan.

Comment No. 2: Drawing No. 2 of the Geotechnical Report should be revised to show the proposed structure foundations of PROJ-2023-00108 with the boring locations added to relation to proposed foundations.

Response: As noted in Response to Comment No. 1, a design level investigation will be conducted as indicated in the Response to Comment No. 1. As requested, the borings from the preliminary geotechnical engineering investigation have been shown on one of the site plans provided.

Comment No. 3 Section 5.8 of the Geotechnical Report indicates that the project site is located in the near vicinity of several active faults. Drawing No. 3 depicts two mapped segments of the Lenwood-Lockhart Fault Zone trending directly toward the project site. An evaluation of potentially active faults within the subject site per County Development Code chapter 82.15 is required.

Response: Moore Twining Associates, Inc. recently issued a report entitled, "Geologic/Seismic Hazards Report, Proposed Electric Charging Truck Station with Travel Center, APNs 0497-142-(03, 04, 14, and 15), Southeast

of Lenwood Road and Agate Road, Barstow, San Bernardino County, California," dated June 25, 2024. In this report, we noted, "The project site is not located in an Alquist-Priolo Earthquake Fault Zone mapped by the California Geological Survey, nor a San Bernardino County designated fault zone (based on the San Bernardino County Land Use Plan, Geologic Hazard Overlays)." However, we also noted in our June 25, 2024 Geologic/Seismic Hazards Report, "The Fault Activity Map of California identifies an active, creeping segment of the Lenwood-Lockhart fault zone (Lenwood section) mapped just east of the southern portion of the site. The nearest active fault with traditional surface rupture is a section of the Lenwood-Lockhart fault zone further southeast of the site, about 2.1 miles from the site. A concealed, potentially active fault (Lockhart section) associated with the Lenwood-Lockhart fault zone is mapped about ¾ mile to the northwest. The approximate locations of these fault sections are shown on Drawing No. 3 in Appendix A of our June 25, 2024 Geologic/Seismic Hazards Report. Based on the documents reviewed, since active faults are not mapped within the site, the potential for surface rupture due to a known active fault appears to be low. However, potential impacts from the adjacent Lenwood fault section are recommended to be evaluated if a future structure is planned within a hypothetical northwesterly extension of this fault section which is shown east of the site." Thus, future subsurface fault investigation will be needed as noted in our June 25, 2024 Geologic/Seismic Hazards Report.

Comment No. 4: Section 5.9 of the Geotechnical Report shall be updated to reflect to most current CBC design specifications.

Response: The report includes reference to the 2019 California Building Code (CBC). The references in the report to the 2019 CBC may be replaced with the 2022 CBC (values in Section 6.6 remain unchanged). When the design level geotechnical engineering investigation is conducted based on the finalized site plan, the future geotechnical report will reflect the most current CBC seismic factors to be used for design.

Comment No. 5: Section 5.10 of the Geotechnical Report states that "Based on the depth to groundwater, liquefaction is not considered a potential impact to the site." However, no data concerning existing groundwater elevations within or near the project site were provided to support that conclusion. An assessment of

current groundwater elevations within or near the project site is required.

Response: Refer to Section 5.4 Groundwater Conditions of the referenced July 29, 2022 Preliminary Geotechnical Engineering Investigation report. Considering the groundwater data reviewed, Moore Twining concluded that liquefaction was not considered a potential impact to the site.

CLOSING

Our professional services were performed, our findings obtained, and our recommendations prepared in accordance with generally-accepted engineering principles and practices. This warranty is in lieu of all other warranties either expressed or implied.

If we can be of any further assistance, please contact us at your convenience.

Sincerely,
MOORE TWINING ASSOCIATES, INC.

1.0 INTRODUCTION

This report presents the results of a geologic/seismic hazards review for the proposed electric charging truck station and travel center to be located southeast of the intersection of Lenwood Road and Agate Road in Barstow, San Bernardino County, California. Moore Twining Associates, Inc. (Moore Twining) was authorized by EVC Partners, LLC, to conduct this investigation.

The contents of this report include the purpose of the report and the scope of services provided. The site history, previous studies, site description, and anticipated construction are discussed. In addition, a description of the site reconnaissance and the subsequent findings obtained are presented. Finally, the report provides an evaluation of the findings, an evaluation of geologic and seismic hazards, and general conclusions and recommendations. The report appendices contain the drawings (Appendix A), logs of borings from 2022 preliminary geotechnical engineering investigation (Appendix B), the results of laboratory tests from 2022 preliminary geotechnical engineering investigation (Appendix C), liquefaction analysis (Appendix D) and photograph log (Appendix E).

The Geotechnical Engineering Division of Moore Twining, performed the investigation.

2.0 PURPOSE AND SCOPE OF INVESTIGATION

2.1 Purpose: The purpose of the investigation was to provide the following:

2.1.1 A general site location/regional geologic map;

2.1.2 A general description of the subsurface soil and groundwater conditions encountered from our previous investigation at the site and review of published geologic information related to the site;

2.1.3 Summary of review of historic, low elevation aerial photographs for signs of potential fault surface rupture hazards;

2.1.4 Preparation of a site geologic map of the site and nearby surrounding area based on visual site observations, the previously drilled soil borings, and published geologic maps;

2.1.5 Preparation of a cross sections showing actual or probable geologic structure using Moore Twining's previous boring data, information collected from the geologic site reconnaissance, and regional geologic and fault hazard maps.

2.1.6 Summary of our review of historical seismicity, including an historical earthquake epicenter map relative to the site;

2.1.7 Discussion of potential geological hazards such as faulting, flooding, dam inundation, landslides, tsunamis, seiches, volcanic activity, expansive soils, hydrocollapse, and liquefaction and seismic settlement;

2.1.8 A statement of conclusions and any appropriate recommendations or mitigation measures regarding potential geologic hazards associated with active faulting;

2.1.9 A list of references used in preparation of the report.

This report is provided specifically for the electric truck charging station and travel center referenced in the Anticipated Construction section of this report. This report is a geologic/seismic hazards report and is not a geotechnical engineering investigation report. It should be noted that Moore Twining previously provided a report entitled, "Preliminary Geotechnical Engineering Investigation, Proposed Electric Charging Truck Station with Travel Center, APNs 0497-142-(03, 04, 14, and 15), Southeast of Lenwood Road and Agate Road, Barstow, San Bernardino County, California," dated July 29, 2022, Moore Twining Project No. H07603.02. The referenced report was preliminary in nature as design details for the future development were not known at the time the report was prepared. The scope of work for this geologic/seismic hazards report did not include a subsurface fault trenching exploration.

2.2 **Scope:** Our proposal, March 6, 2024, outlined the scope of our services. The actions undertaken to complete this report are summarized as follows.

2.2.1 A visual site reconnaissance was conducted.

2.2.2 The Topographic Map for the Barstow Quadrangle, California, dated 1993, prepared by the US. Department of Interior, Geological Survey, was reviewed.

2.2.3 A report, entitled: "Phase I Environmental Site Assessment Proposed Land Development, Southeast Corner of Lenwood Road and Agate Road, Barstow, California 92311, dated June 15, 2022, prepared by our firm, was reviewed for general background information.

2.2.4 A report entitled: "Preliminary Geotechnical Engineering Investigation, Proposed Electric Charging Truck Station with Travel Center, APNs 0497-142-(03, 04, 14, and 15), Southeast of Lenwood Road and Agate Road, Barstow, San Bernardino County, California," dated July 29, 2022, was reviewed for general background information.

2.2.5 The "San Bernardino County Land Use Plan, General Plan, Geologic Hazard Overlays," dated May 30, 2007, was reviewed. In addition, Policy Map HZ-1 Earthquake Fault Zones, Policy Map HZ-2 Liquefaction & Landslide Hazards, Policy Map HZ-3 Dam & Basin Hazards, and Policy Map HZ-4 Flood Hazards, all dated October 27, 2020, were reviewed from the Hazards Element of the San Bernardino Countywide Plan.

2.2.6 The Geologic Map and Borehole Stratigraphy of Hinkley Valley and Vicinity, San Bernardino County, California, dated 2020, prepared by David M. Miller, Victoria E. Langenheim, and Elizabeth K Haddon, was reviewed.

2.2.7 A report entitled, "Fault Evaluation Report FER-177, Lenwood Fault, Old Woman Springs Fault, and Silver Reef Fault, San Bernardino County," dated June 11, 1986, prepared by Michael Manson and the California Division of Mines and Geology, was reviewed.

2.2.8 A report entitled, "Fault Evaluation Report FER-189, Recently Active Traces of the Blackwater, Harper, Lockhart and Related Faults near Barstow, San Bernardino County," dated July 20, 1987, prepared by William A. Bryant, Associate Geologist, and the California Division of Mines and Geology, was reviewed.

2.2.9 A description of the Lenwood-Lockhart fault zone, Lenwood section (Class A), No. 111b, prepared by W.A. Bryant, dated 2000, from the Quaternary Fault and Fold Database in the United States: U.S. Geological Survey website, https://earthquakes.usgs.gov/hazard/qfaults, was reviewed.

2.2.10 Historical aerial photographs from various years between 1953 and 2020 were reviewed. Satellite images of the site between May 1994 and June 2023 from online sources, were also reviewed. In addition, stereo pair aerial photographs for the years 1953, 1968, and 1978 were reviewed.

2.2.11 Mr. Brian Vail (EVC Partners, LLC) was consulted during the work.

2.2.12 This report was prepared to present the purpose and scope, background information, geologic site reconnaissance, findings, evaluation of geologic and seismic hazards, and conclusions and recommendations.

3.0 BACKGROUND INFORMATION

The site description, site history and previous studies, and the anticipated construction are summarized in the following subsections.

3.1 Site Description: The project site is generally located southeast of the intersection of Lenwood Road and Agate Road in the Barstow area of San Bernardino County, California. The site is located just outside of the city limits of Barstow and less than ½ mile northwest of the community of Lenwood (see Drawing No. 1 in Appendix A of this report). The site has been assigned the following Assessor's Parcel Numbers (APNs): 0497-142-03, -04, -14, and -15.

The site is roughly rectangular in shape and covers about 96 acres. The site is bounded by Lenwood Road to the west, by vacant land and residential developed properties to the north with Agate Road beyond, by a residential subdivision to the south, and by vacant land to the east.

The site consists of rolling terrain generally ranging from about 2,280 feet above mea sea level (AMSL) along the eastern portion of a ridge in the southern portion of the site to about 2,192 feet AMSL near the northeastern corner of the site. Several small and shallow washes were noted through out the site. At the time of our investigation, the site was covered with scattered seasonal vegetation consisting of weeds, desert shrubs and grasses. Dirt roads or paths that appeared to be used by offroad vehicles were noted through out the site, including a path along the western side of the site, parallel to Lenwood Road. Loose, sandy soils were noted at the ground surface in some portions of the site. Fine to coarse gravel fragments were noted to be scattered across the ground surface. Four (4) ridges, generally trending east to west, with exposed beds of volcanic rock were noted at the site and are discussed further in the Geologic Site Reconnaissance (Section 4.3) of this report.

Buried fiber optic utility markers were observed along the western boundary of the project site trending from south to north.

3.2 Site History: Based on review of historical satellite images of the site dating from 1953 to 2023, the conditions of the site have not changed significantly from 1953 to those described at the time of our geologic site reconnaissance conducted on May 22, 2024.

3.3 Previous Studies: The previously referenced report entitled: "**Phase I Environmental Site Assessment, Proposed Land Development, Southeast of Lenwood Road and Agate Road, Barstow, California 92311***"* prepared by our firm, was reviewed for general background information.

In addition, the previously referenced report entitled: "**Preliminary Geotechnical Engineering Investigation, Proposed Electric Charging Truck Station with Travel Center, APNs 0497-142-(03, 04, 14, and 15), Southeast of Lenwood Road and Agate Road, Barstow, San Bernardino County, California**," dated July 29, 2022, was reviewed for general background information. Findings regarding the subsurface soil and groundwater conditions from the borings drilled from our 2022 preliminary geotechnical engineering investigation are summarized in Sections 4.4 and 4.5 of this report.

Two fault evaluation reports were reviewed. One report includes discussion of the Lenwood fault which is mapped southeast of the site and extending further to the southeast. The other report includes description of the Lockhart fault which is mapped west of the site and extending further to the northwest. The Lenwood fault and the Lockhart fault make up the Lenwood-Lockhart Fault Zone. The fault evaluation reports and additional information regarding the Lenwood-Lockhart Fault Zonefrom the Quaternary Fault and Fold Database of the United States are discussed in Section 4.2 of this report.

3.4 Anticipated Construction: Based on our understanding, a new electric charging truck station with a travel center is being planned at the site. A site plan was not available at the time this report was prepared. However, in general, the future development is anticipated to include a fueling canopy and areas for charging electric vehicles. A travel shop, truck service building and possibly a restaurant building may also be planned. Based on the rolling terrain, cuts and fills on the order of 5 to 10 feet or greater may be required to establish design grades for the project.

4.0 FINDINGS AND RESULTS

The findings from research of geologic maps and literature and the referenced 2022 geotechnical exploration and laboratory testing are summarized in the following subsections.

4.1 Mapped Geologic and Soils Conditions: The Geologic Map and Borehole Stratigraphy of Hinkley Valley and Vicinity, San Bernardino, California, dated 2020 (see Drawing No. 5 in Appendix A) indicates that the subject site is underlain by three (3) units.

The Miocene-age Barstow Formation (Tb) covers the majority of the site and is described as sandstone, siltstone, limestone, and minor volcanic rocks near Lenwood. These rocks are described as being older than 19 million years old to approximately 14 million years old.

Portions of the central and western sides of the site are shown to be underlain by Young Mixed Alluvial and Eolian deposits (Qyae) that are described as being Holocene to Pleistocene age. This unit is described as follows: *"Deposit consists of alluvial and eolian sediments that are thoroughly mixed....Deposits are moderately sorted to well-sorted sand and gravel. Sediments are typically loose. Soil development and desert pavement are similar to or less pronounced than that exhibited by correlative alluvial-fan units. Deposits form more muted topographic surfaces than alluvial-fan surfaces lacking significant eolian sand. Surfaces are sparsely vegetated, generally supporting creosote bush, white bursage, and perennial grasses. Deposits grade completely toward eolian-sand sources by increase of sand component and decrease of discrete alluvial beds."*

The northwestern portion of the site is shown to be underlain by Young Mojave River deposits, unit 3 (Qymr3) which is described as middle Holocene age. This unit is described as *"arkosic gravel, sand, and silt with reddish quartzite pebbles. Well bedded with typical fluvial stream-deposit characteristics, such as normal grading, cross-beds, and less common crevasse splay and floodplain sediment. Deposit displays bar and swale topography lies 1-2 meters above modern river channel elevation."*

During the geologic site reconnaissance described below in Section 4.3, the Young Mixed Alluvial and Eolian deposits (Qyae) were generally observed as eolian "dune-like" deposits in the most of the western lower lying portion of the site (see Photograph No. 16 in Appendix E of this report), and volcanic rocks of the Barstow Formation were observed along four (4) different ridges that were much higher in elevation (see Photograph Nos. 9 through 15 in Appendix E of this report).

Based on our review of the soil survey maps, prepared by the U.S. Department of Agriculture, Natural Resources Conservation District, the majority of the site is shown to be underlain by rock-outcrop-lithic torriorthents complex, 15 to 50 percent slopes which is described as unweathered rock outcrop bedrock in the upper 10 inches and lithic torriorthents in the upper 15 inches underlain by bedrock from 15 to 29 inches below site grade (BSG). Other portions of the site are shown to be

underlain by the Victorville sandy loam described as silty sands from 0 to 35 inches BSG, silty sands and poorly graded sands with silt from 35 to 49 inches and lean clays with sand or sandy lean clays from 49 to 60 inches BSG. Other smaller portions of the site are mapped as being underlain by the Cajon sand, 2 to 9 percent slopes, which is described as silty sands and poorly graded sands from 0 to 60 inches BSG; dune land (with no description); and the Joshua loam, 2 to 5 percent slopes, which is described as interbeds of silty clay, clayey sand and silty, clayey gravel from depths of 0 to 59 inches BSG.

4.2 Published Literature Regarding the Lenwood-Lockhart Fault Zone: A report entitled, "**Fault Evaluation Report FER-177, Lenwood Fault, Old Woman Springs Fault, and Silver Reef Fault, San Bernardino County**," dated June 11, 1986, prepared by Michael Manson and the California Division of Mines and Geology, was reviewed.

This Fault Evaluation Report included descriptions of the Lenwood, Old Woman Springs, and Silver Reef faults, which are located in southwestern San Bernardino County, California. The Lenwood fault is mapped in the vicinity of the site while the Old Woman Springs fault and Silver Reef fault are both located over 40 miles southeast of the site and parallel to the southern end of the Lenwood fault.

The report indicates: *"The Lenwood fault is one of a series of subparallel, northwest-trending, right-lateral, strike-slip faults in the western Mojave Desert...The Lenwood fault was mapped in its entirety and named by Dibblee (1960a, 1964b, 1964c, 1967b, 1970)...Dibblee shows the Lenwood fault to have a total length of approximately 70 km (44 miles), trending northwestward from the San Bernardino Mountains to the Mojave River at Lenwood. He interprets the fault to be vertical in cross-section, with various senses of vertical offset (Dibblee, 1960a, 1967b, 1970). Right-lateral strike-slip displacement is indicated locally in the Daggett, Ord Mountains, and Old Woman Springs 15' quadrangles, with inferred right-slip shown in the Barstow 15' quadrangle. The youngest unit clearly shown to be offset by the Lenwood fault is Holocene alluvium in sec. 23 in the Rodman Mountains quadrangle; however, this may be drafting error. Where bedrock units or Pleistocene alluvium are truncated by faulting, Dibblee generally shows the unit to be faulted against young alluvium (for example, at Soggy Lake, Lucerne Valley, and Tyler Valley). Elsewhere, the fault is shown as concealed by young alluvium of Holocene or undifferentiated Holocene and Pleistocene age."*

The report also indicated, *"Morton and others (1980) used black-and-white, low-sun-angle air photos to produce their photo reconnaissance map of fault-related features along the Lenwood fault. Their annotated strip map shows alignments of scarps and tonals in younger and older alluvium, and alignments of saddles, linear trenches and drainages, closed depressions, etc. in bedrock along the general trend of the fault as mapped by Dibblee. However, they did not field-check the*

geomorphic features, nor do they discuss recency of faulting. Their data are plotted on 1:24,000- and 1:62,500–scale maps, and comprise the single most-important source of information on recently-active traces of the Lenwood fault. Most of the fault-related features shown by Morton and others were verified by photo-inspection and field-inspection during this study. Annotations such as 'scarps appear to cut youngest alluvium' suggest that the fault has been active in Holocene time."

The report also indicated, *"In January 1973, D.M. Morton (U.S. Geological Survey) and C.H. Gray (California Division of Mines and Geology) investigated reports of structural damage to 6 homes in Lenwood. The damage consisted of cracks (less than 2 cm wide) in the walls of these homes ©. Gray, 1986, written comm.), although D.M. Morton (1986, pers. comm.) stated that one of the home on Cheryl (Cheryle) Street was skewed '2 or 3 inches' off its slab foundation and had to be torn down. The alignment of damaged homes shown on the map provided by Gray has a significantly more northerly trend than the shallow linear swale shown by Morton and others."*

Regarding lateral displacement of the Lenwood fault, the report indicated the following: *"Garfunkel (1974) calculates that 15-20 km of right-lateral displacement has occurred since Miocene time, based upon locations of 'offset' Paleozoic marine sedimentary rocks....Doka (1983, p. 307) calculates the right-lateral displacement along the Lenwood fault is no greater than 1.5 to 3.0 km. His estimate is based on measurements of an offset, high-angle, southern margin of an early Miocene detachment fault terrane."*

Based on air photo interpretations and field observations, the report indicates the following about the Lenwood fault: *"The Lenwood fault is generally well-defined in discontinuous segments from just east of Barstow Road (Highway 247) in Stoddard Valley, southeastward to Stony Ridge Road, northeast of Old Woman Springs. Recently-active traces can be followed as alignments of scarps, linear drainages, sidehill benches, breaks-in-slope, shutter ridges, closed depresssions, deflected drainages, and offset alluvial fans. Southeast of Stony Ridge Road, the fault is largely concealed by young alluvium, although its position near Highway 247 (Barstow Road) is suggested by an en echelon alignment of knolls, scarps, and weak tonals in late Quaternary alluvium. Geomorphic evidence of recent faulting is rather discontinuous from near Barstow Road northwestward to the vicinity of Lenwood....The existence of shutter ridges and offset drainages, fans, and valleys along the fault clearly indicate a dominant element of right-lateral strike-slip displacement, but scarps and depressions suggest that components of dip-slip are locally important."*

The report indicates evidence of Holocene rupture along the Lenwood fault is located in areas southeast of the subject site, *"where large closed depression (graben) has been formed by the main fault and a westerly branch fault. Here, the main trace is a well-defined, southwest-facing scarp, up to 7 meters high, in an alluvial fan of latest Pleistocene to early Holocene age. Holocene alluvium abuts the scarp, and may be faulted....Evidence of latest Pleistocene or Holocene faulting is found in a small, unnamed valley (closed depression)...west of Tyler Valley. This is where Dibblee (1964b) shows faulted Holocene alluvium."*

A report entitled, "**Fault Evaluation Report FER-189, Recently Active Traces of the Blackwater, Harper, Lockhart and Related Faults near Barstow, San Bernardino County**," dated July 20, 1987, prepared by William A. Bryant, Associate Geologist, and the California Division of Mines and Geology, was reviewed.

The Harper Fault Zone, discussed in Fault Evaluation Report FER-189, is located about 9 miles north of the site and trends northwest-southeast, parallel to the Lenwood-Lockhart Fault Zone. The Blackwater Fault Zone is located on the northeast side of the Harper Fault Zone and also trends northwest-southeast. The Lockhart Fault is located on the west side of the site and continues further to the northwest. The North Lockhart fault and South Lockhart fault generally trend parallel to the Lockhart fault on the northeast and southwest sides of the Lockhart fault, respectively. The North Lockhart fault is about 19½ miles northwest of the site, and the South Lockhart fault is about 16½ miles west-northwest of the site. For the purpose of this report, discussion is included from Fault Evaluation Report FER-189 regarding the Lockhart fault which is mapped directly west of site and extending further to the northwest.

The report indicates, *"The Lockhart fault is a 40 km-long, northwest-trending high-angle fault mapped by Dibblee (1958, 1968) and Page and Moyle (1960). The magnitude of displacement along the Lockhart fault is not known, but Dibblee (1968) stated that the fault is right-lateral strike-slip with a component of down-to-the-northeast vertical displacement. The Lockhart fault offsets Quaternary alluvium and juxtaposes Holocene alluvium against older (Pleistocene) alluvium." The report indicates that Page and Moyle (1960) extended the Lockhart fault about 25 km to the southeast of the southeast end of the Lockhart fault that Dibblee had mapped. The report indicated, "The existence of this southeastern projection of the Lockhart fault is probably based on water well data. An apparent groundwater barrier in the older alluvium of Page and Moyle (1960) is indicated by a difference in water levels of 22.18 feet...Several wells in older alluvium within 1 km of the southwest side of the fault have water levels that range from 48 feet to 64 feet. The non-uniformity of depths to ground water indicates that there may be rapid facies changes within the older alluvium, more than one aquifer, or folding or faulting of a single aquifer along a broad zone of faulting approximately 1 km wide."*

The report further indicates, *"Dibblee (1958) mapped an inferred branch fault along the northern end of the Lockhart fault as offsetting Holocene alluvium. This fault segment is also associated with small playas, possibly suggesting recent ground deformation. However, Dibblee (1985) concluded that the Lockhart fault is not Holocene active, but was active about 200ka (200,000 years ago). Dibblee (1985) stated that the Lockhart fault shows little topographic expression, but is prominent on air photos."*

Based on air photo interpretations and field observations, the report indicates the following about the southernmost segment of the Lockhart fault closest to the subject site: *"The southernmost segment of the fault mapped by Page and Moyle (1960) is poorly defined and was not verified in the older alluvium by this writer." The report indicates the following regarding the best-defined segment of the Lockhart fault. "The best-defined segment of the Lockhart fault is delineated by a moderately well-defined, northeast-facing scarp in what Dibblee (1968) mapped as Pleistocene alluvium. The Pleistocene alluvium at this location is probably older than 100 ka (100,000 years old) and possibly older than 500 ka (500,000 years old), based on multiple K (pedogenic carbonate) horizons, degree of induration and dissection of the alluvium. This segment of the fault is characterized by a significant component of up-on-the-southwest vertical displacement; geomorphic evidence of right-lateral strike-slip displacement was not observed." Further to the northwest, the report indicates, "Geomorphic features such as linear ridges in crystalline bedrock and right-laterally deflected drainages are permissive of Holocene strike-slip faulting, but may be enhanced by differential erosion. This southeastern segment of the Lockhart fault is probably characterized by a late Quaternary slip-rate of less than 1 mm/yr."*

A description of the **Lenwood-Lockhart fault zone, Lenwood section (Class A), No. 111b**, prepared by W.A. Bryant, dated 2000, from the Quaternary Fault and Fold Database in the United States: U.S. Geological Survey website, https://earthquakes.usgs.gov/hazard/qfaults, was reviewed.

Additional information regarding the Lenwood fault from this document indicated, *"Traces of the Lenwood fault at Soggy Lake had up to 5 centimeters of triggered dextral displacement associated with the 1992 Mw 7.3 Landers earthquake (Hart and others, 1993 #3356)...Padgett (1994 #6643) excavated two fault normal trenches across the traces of the Lenwood fault at Soggy Lake and exposed evidence of 3 paeloearthquakes in the past 8.2 ka (8,200 years). Padgett's (1994 #6643) event chronology identified large surface-faulting events 1.8±0.2 ka (1,800 years ± 200 years) was interpreted by Padgett to be a small displacement event, probably similar to the triggered slip observed along the Lenwood fault after the 1992 Landers earthquake. Padgett (1994 #6643) concluded that the Lenwood fault ruptures in 3-m displacement events and estimated a Holocene slip rate of about 0.5 millimeters/year. Peterson and Wesnousky (1994 #6024) estimated a preferred long term slip rate of 0.8 millimeters/year (0.05-1.5 mm/yr), based on 1.5-3.0 kilometer dextral offset*

of the Kane Springs fault and initiation of slip between 2 Ma and 20 Ma (2 million and 20 million years ago)." The document also indicates, *"Southeast of Lenwood, the Lenwood-Lockhart fault zone strikes about North 30 degrees West and is delineated by generally well defined geomorphic evidence of Holocene dextral displacement. Northwest of Lenwood, the fault zone strikes North 55 to 60 degrees West and, though locally there is geomorphic evidence of Holocene dextral slip, the fault zone generally lacks geomorphic evidence of Holocene displacement (Manson, 1986 #6642; Bryant, 1987 #6626)."* The document also indicates, *"Peterson and others (1996 #4860) modeled a Mw 7.3 earthquake along the Lenwood, Lockhart, and Old Woman Springs [117] faults and termed this fault zone the Lenwood-Lockhart fault zone....Lenwood section proposed in this compilation, based on fault source modeling by Peterson and others (1996 #4860). Section extends from the town of Lenwood southeast to the northern front of the San Bernardino Mountains."*

No previous geotechnical engineering reports or geological studies conducted for this site were provided for our review. If these documents are available they should be provided to Moore Twining for review.

4.3 <u>Geologic Site Reconnaissance</u>: A geologic site reconnaissance was conducted by a Moore Twining Certified Engineering Geologist on May 22, 2024 at the subject site and some adjacent lands. The general site conditions observed from our previous 2022 Preliminary Geotechnical Engineering Investigation are described in Section 3.1 of this report. Additional findings from the May 22, 2024 site reconnaissance are described in this section.

Prior to the geologic site reconnaissance, stereo pair aerial photographs were reviewed for the years 1953, 1968, and 1978 for surface conditions that may be evidence of active faulting at the subject site. The stereo pair aerial photographs for the years 1953, 1968 and 1978 did not show any evidence of active faulting at the subject site.

During the geologic site reconnaissance, the mapped, active portions of the Lenwood fault were reviewed (area shown southeast of the site in red color on Drawing No. 3 and southeast of the site in red and orange colors on Drawing No. 4 in Appendix A of this report). The report entitled, "Fault Evaluation Report FER-177, Lenwood Fault, Old Woman Springs Fault, and Silver Reef Fault, San Bernardino County," dated June 11, 1986, prepared by Michael Manson and the California Division of Mines and Geology, was reviewed prior to the geologic site reconnaissance. Figure 4 from the Fault Evaluation Report FER-177 indicated the location of the Lenwood fault southeast of the Interstate 15 freeway (southeast of the subject site) was based on tonal evidence, truncated Quaternary beds, and offset ridges and drainages. During the geologic site reconnaissance, the tonal evidence was observed where the northeast side of the fault included soil with coarse gravel, cobbles and boulders with very little sparse grasses vegetation growth while the southwest side of the fault include soil with fine gravel and abundant dried grasses vegetation growth (see photograph Nos. 1 through 3 in Appendix E of this report). A drainage on the southeast side of the Interstate I-15 freeway, southeast of the subject site, was also observed to exhibit a few feet of right-lateral strike-slip movement from the Lenhart fault (see photograph No. 4 in Appendix E of this report).

The Fault Evaluation Report FER-177 and Drawing No. 3 in Appendix A of this report indicates that the Lenwood fault has also been mapped through a residential neighborhood in the community of Lenwood, located about ½ mile southeast of the subject site. Evidence such as offset curbs from the Lenwood fault were not observed in this residential neighborhood where the Lenwood fault has been mapped.

In addition, a shallow, linear swale was mapped as an active fault feature of the Lenwood fault in the Fault Evaluation Report FER-177, directly southeast of the southeast portion of the subject site. This shallow feature was observed during the geologic site reconnaissance and is shown on Drawing No. 3 in Appendix A of this report and in photograph Nos. 5, 6 and 17 in Appendix E. The shallow linear swale (active surficial portion of the Lenwood fault) did not extend into the subject site.

As shown on Drawing No. 5 in Appendix A of this report (Regional Geologic Map), the subject site is mostly covered by the Barstow Formation which is noted as consisting of volcanic rock in the Lenwood area where the site is located. Four (4) ridges of volcanic rock were noted throughout the site. The ridges generally trended from east to west in various portions of the site. Where the volcanic rock was observed on these ridges, bedding planes of steeply dipping volcanic rocks were measured. Refer to Drawing No. 7 (Site Geologic Map) for the approximate areas of the ridges described in this report where strike and dip bedding attitudes are shown.

The first ridge was an S-shaped ridge in the southern portion of the site. This ridge crossed the majority of the site and exhibited two distinct bedding planes of steeply dipping volcanic rocks that followed the top of the S-shaped ridge. The bedding planes of the volcanic rock along this ridge dipped down about 43 to 50 degrees to the south in the eastern portion of the site. These beds are shown on photograph Nos. 9 and 10 in Appendix E of this report, and the strike and dip attitudes of the bedding measured are shown on photograph No. 17 in Appendix E of this report. The bedding plane of the volcanic rock was less steep and dipped down about 38 degrees to the south in the central portion of the site (see photograph Nos. 11 and 17 in Appendix E of this report). The volcanic rock was not observed along the ridge in the western portion of the site where the ridge decreased in elevation. No evidence of offset of the steeply dipping volcanic beds was observed that would be indicative of faulting at the ground surface.

A second ridge was observed about 475 feet north of the western portion of the first ridge in the western portion of the subject site. This ridge also include steeply dipping volcanic rock that dipped down about 58 degrees to the south (see photograph Nos. 12 and 17 in Appendix E of this report). No evidence of offset of the steeply dipping volcanic beds was observed that would be indicative of faulting at the ground surface.

A third ridge was observed in the central-eastern portion of the site, about 1,125 feet north of the eastern portion of the first ridge. This ridge also included steeply dipping volcanic rock that dipped down about 77 degrees to the south and was spray painted with graffiti (see photograph No. 13 in Appendix E of this report and the strike and dip attitude of the bedding measured and shown on photograph No. 17 in Appendix E of this report). No evidence of offset of the steeply dipping volcanic beds was observed that would be indicative of faulting at the ground surface.

A fourth ridge was observed about 650 feet north of the third ridge in the northern portion of the subject site. This was a long, broad ridge that trended east to west across the majority of the site, except for the westernmost portion of the site. This ridge also included steeply dipping volcanic rock that dipped down to the north and south. Two bedding attitudes taken along the western portion of the south side of this ridge dipped steeply down about 56 to 65 degrees to the north (see photograph No. 14 in Appendix E of this report). Other volcanic beds further to the west along the ground surface at the top of this ridge were completely vertical (dipping down 90 degrees). Another area on the north side of this ridge had some volcanic rocks with near vertical bedding and was measured to dip down about 80 degrees to the south (see Photograph No. 15 in Appendix E of this report). The volcanic beds dipping north and south along this ridge appear to be evidence of a syncline and an anticline, or folds in the stratified rock (see approximate axis of syncline and anticline shown on Drawing No. 7 in Appendix A of this report). No evidence of offset of the steeply dipping volcanic beds was observed that would be indicative of faulting at the ground surface.

The strike and dip bedding attitudes measured along the ridges of the volcanic rock (Barstow Formation) have similar high-angle dip measurements to those shown on the Regional Geologic Map (Drawing No. 5 in Appendix A of this report) which included dip measurements in the northern portion of the site of 83 and 88 degrees to the south and a dip measurement in the southern portion of the site of 67 degrees to the south. The strike and dip bedding attitudes measured along the ridges of the volcanic rock (Barstow Formation) during the geologic site reconnaissance are shown on Photograph No. 17 in Appendix E of this report on a satellite image from 2009. This 2009 image was chosen to be used as it clearly shows the rock and vegetation covering the site in black in contrast to other recent aerials of the site in which the rock and vegetation are shown as being very faint.

Beyond the ridges, other areas of the site were lower in elevation and either covered by sand and scattered gravel-size pieces of rock or by eolian “dune-like” fine-grained sands as shown in photograph No. 16 in Appendix E of this report. The “dune-like” fine-grained sands were most prevalent in the western portion of the site as shown on Drawing No. 7 in Appendix A where geologic unit Qyae is shown for Holocene to latest Pleistocene-age Young mixed alluvial and eolian deposits and the geologic unit Qymr3 is shown for the Holocene-age Young Mojave River deposits, unit 3.

No evidence of faulting such as horizontal/vertical offset in the volcanic beds of the Barstow Formation along the ridges at the site. In addition, no ground cracking, offsets in washes, or other evidence of potential active faulting was observed along the ground surface in any of the other portions of the site lower in elevation where surficial deposits cover the Barstow Formation and where the Holocene to latest Pleistocene-age Young mixed alluvial and eolian deposits (Qyae unit) and the Holocene-age Young Mojave River deposits, unit 3 (Qymr3 unit), are mapped as shown on Drawing No. 7 in Appendix A of this report.

4.4 Soil Profile: The following is a summary of soils encountered during the geotechnical borings drilled for our 2022 preliminary geotechnical engineering investigation. Due to access constraints from the loose sandy surface soils, the drill rig borings were limited to the western portion of the site along an existing dirt access road (see Drawing No. 2 in Appendix A of this report). Additionally, one (1) exploratory boring was conducted using a hand-auger to an approximate depth of 3 feet BSG in the eastern portion of the site. The near surface soils encountered in these borings included poorly graded sands and silty sands to depths of about 3½ to 10 feet BSG. The near surface sandy soils were underlain by interbedded layers of lean clay, sandy silt, silty sand, deeper poorly graded sands, and clayey sand to the maximum depth explored of about 35½ feet BSG. At a depth of about 35½ feet BSG, practical auger refusal was encountered in test boring B-2 due to a strongly cemented layer. It is possible that refusal may have been encountered on weathered volcanic bedrock materials of the Barstow Formation which are shown as a queried unit on Drawing No. 8 (Cross Section A-A') in Appendix A of this report.

The near surface sandy soils encountered in the previous geotechnical borings in the upper 3½ to 5 feet BSG were loose to medium dense. The underlying silts and clays were generally stiff to hard, with the exception of a soft silt layer encountered at a depth of about 10 feet in boring B-2. The deeper granular soils (poorly graded sands, silty sands and clayey sands) were medium dense to very dense. Cross section A-A' shows the general soil profile along the western side of the site where the borings were drilled with the drill rig and is included as Drawing No. 8 in Appendix A of this report. Drawing No. 9 (Cross Section B-B') is also included in Appendix A of this report trending from north to south, showing the Barstow Formation and queried surficial soils covering the Barstow Formation across the four ridges in the eastern portion of the site.

The foregoing is a general summary of the soil conditions encountered in the test borings drilled for this investigation. Detailed descriptions of the soils encountered at each test boring location are presented in the logs of borings in Appendix B. The stratification lines in the logs represent the approximate boundary soil types; the actual in-situ transition may be gradual.

4.5 Groundwater Conditions: Groundwater was not encountered in any of the test borings to the maximum depth explored of about 35½ feet BSG.

Historical ground water data from the Department of Water Resources indicates that a well located about 500 feet north of the site indicates that ground water has ranged from as deep as about 108 feet BSG in 1992 to as shallow as about 51 feet BSG in 1993. The most recent measurement from this well indicated a depth of about 73 feet BSG in September 2023.

It should be recognized, however, that groundwater elevations fluctuate with time, since they are dependent upon seasonal precipitation, irrigation, land use, and climatic conditions as well as other factors. Therefore, water level observations at the time of the field investigation may vary from those encountered both during the construction phase and the design life of the project. The evaluation of such factors was beyond the scope of this investigation and report.

5.0 GEOLOGIC AND SEISMIC HAZARDS EVALUATION

The geologic and seismic hazards are discussed in the following sections. The conclusions obtained from the results of our evaluations of the geologic and seismic hazards are described in the Conclusions and Recommendations section of this report.

5.1 Geomorphic and Geologic Setting: Barstow is located in the Mojave Desert province in San Bernardino County, California. The site is located just outside of the city limits of Barstow and less than ½ mile northwest of the community of Lenwood and less than ¼ miles west of the community of Grandview (see Drawing No. 1 in Appendix A of this report).

The Mojave Desert province is bordered by the Garlock Fault Zone and Sierra Nevada province beyond to the northwest and the San Andreas Fault Zone and the Transverse Ranges province beyond to the southwest. Several active, potentially active faults and inactive faults within the Mojave Desert province generally trend in a northwest to southeast orientation.

Based on the map of active and potentially active faults from the USGS Quaternary fault mapping shown on Drawing No. 3 in Appendix A of this report, the Lenwood-Lockhart Fault Zone is mapped near, but not within the subject site. The mapping indicates the Lockhart fault is located about 0.85 miles west of the site and continuing northwest of the site, and the Lenwood fault is mapped directly southeast of the site.

The Fault Activity Map of California, prepared by the California Geological Survey, shown on Drawing No. 4 in Appendix A of this report, also shows the Lockhart fault to the west and northwest sides of the site and trends in a northwest-southeast orientation. The closest portion of the Lockhart fault to the site is shown west of the site on Drawing No. 3 in Appendix A of this report where it is shown as a black dotted line, across the Mojave River. This black dotted symbol is indicative of the fault being an inferred location and being undifferentiated Quaternary age (< 1.6 million years).

Further away from the site to the northwest, the Lockhart fault has en echelon (parallel) faults that are identified as the North Lockhart fault and South Lockhart fault as shown on Drawing No. 4 in Appendix A of this report.

The Lenhart fault is mapped directly southeast of the southeast portion of the site and extends further to the southeast as shown on Drawing Nos. 3 and 4 in Appendix A of this report. The closest active and potentially active segments of this fault closest to the site are also shown on Drawing No. 3 in Appendix A of this report. Two segments are shown as red lines on Drawing No. 3 in Appendix A of this report, directly southeast of the southeast portion of the site. These are noted as well constrained locations and considered to be active portions of the Lenwood fault. Two other segments east and southeast of the site are shown as green dotted lines in the community of Grandview and as a solid green line further to the southeast (east of the community of Lenwood). The dotted pattern indicates that the location in the community of Grandview is an inferred location, and the green color for these faults segments indicate they are Late Quaternary age (<130,000 years) or potentially active portions of the Lenwood fault.

Active or potentially active faults are not known to be mapped within the site. No evidence of active faulting was observed at the site during our field exploration and during the geologic site reconnaissance.

Regional geologic and site geologic maps are included in Appendix A as Drawing Nos. 5 and 7, respectively, and a geologic (soil profile) cross section through borings B-1 through B-4 in the western proposed site is included as Drawing No. 8 in Appendix A of this report. In addition, a geologic (soil profile) cross section trending north to south is included on Drawing No. 9 in Appendix A of this report. The section shows the Barstow Formation and queried surficial soils covering the Barstow Formation across the four ridges in the eastern portion of the site.

Surficial geologic deposits are described in Section 4.1 of this report.

5.2 **Tectonics and Seismicity**: An "active fault" is defined, for the purpose of this evaluation, as a fault that has had surface displacement within the Holocene Epoch (about the last 11,700 years). Potentially active faults also contribute to the seismicity of the site. A widely accepted definition of "potentially active" is a fault that does not show evidence of displacement during the Holocene, but shows evidence of displacement occurring less than 1.6 million years ago (after the beginning of the Pleistocene Epoch). Since the Quaternary Period includes the Holocene and Pleistocene Epochs, Quaternary faults are those that have documented latest fault displacement within the Holocene or Pleistocene Epochs, undifferentiated. Faults showing evidence of displacement older than 1.6 million years are usually classified as "Pre-Quaternary" and "inactive." Pre-Quaternary faults do not impact the site seismicity. The Lenwood fault mapped southeast of the site is shown as being an "active" fault. The Lockhart fault mapped directly west and northwest of the site is shown as being a "potentially active" fault segment, and some other segments of the Lockhart fault further to the northwest are shown as being an "active" fault segment.

The following subsections briefly describe the major fault systems contributing to the seismicity of the site area.

The seismicity of the site area was evaluated based on the results of deaggregation of the 2,475 year return period event (2 percent probability of exceedance in 50 years) using the United States Geological Survey deaggregation website (https://earthquake.usgs.gov/hazards/interactive/), Dynamic Conterminous U.S. 2014 Edition (update). Major active regional faults occur to the southeast and northwest of the project site as well as northeast and southwest of the site (see orange and red colored faults on Drawing No. 4 in Appendix A of this report). The deggregation analysis shows the Old Woman Springs fault as part of the Lenwood-Lockhart Fault Zone. The Woman Spring fault is southeast of the site and is roughly parallel to the Lenwood fault at the southeast end of the Lenwood fault. The Gravel Hills-Harper fault zone occurs north and northwest of the site and contains large active fault segments. The Calico-Hildago fault is located east and southeast of the site and contain large active fault segments.

The primary seismic sources contributing to design seismic ground motion estimates for the site are the Lenwood-Lockhart-Old Woman Springs fault which has a predominant moment magnitude of about 7.2, and numerous gridded fault model point sources (general seismicity not related directly to specific known seismic source) which have predominant moment magnitudes between about 5.5 and 5.6. The Gravel Hills-Harper fault zone, with a predominant moment magnitude of about 7.2, and the Calico-Hidalgo, with a predominant moment magnitude of about 7.1, contribute less significantly to the site seismicity. The nearby major fault systems are depicted on Drawing No. 4 in Appendix A of this report.

5.3 Geologic Hazards: The potential geologic hazards of landslides and conditional geologic hazards are described in the following subsections.

5.3.1 Landslides: The site does include sloping terrain, mostly along the four (4) ridges of volcanic rock described in the geologic site reconnaissance, section 4.3 of this report. The slopes along the north and south sides of the east-west trending volcanic ridges generally had inclinations of about 4 Horizontal to 1 Vertical (4H:1V) or flatter (≤25 percent slope inclinations). The first and second ridges in the southern and southwestern portions of the site have a maximum slope inclination of about 20 percent. The third ridge in the central-eastern portion of the site has a maximum slope inclination of about 25 percent. The fourth long, broad ridge in the northern portion of the site has a maximum slope inclination of a bout 10 percent on the north side of the ridge and a maximum slope inclination of about 20 percent on the south side of the ridge. No evidence of pas slope instability was observed along any of the volcanic ridges. Other areas of the site were relatively flat or had very gently sloping terrain. The United States Geological Survey, Interactive U.S. Landslide Inventory map, (see References for website) does not show any landslides at the site or in the vicinity of the site. Due to the 4H:1V or flatter inclinations of the slopes at the site and the absence of any landslides based on our observations during the geologic site reconnaissance, the potential for landslide hazards at the site is considered to be low.

5.3.2 Expansive Soils: One of the potential geotechnical hazards evaluated at this site is the expansion potential of the near surface soils. Over time, expansive soils will experience cyclic drying and wetting as the dry and wet seasons pass. Expansive soils experience volumetric changes (shrink/swell) as the moisture content of the clayey soils fluctuate. These shrink/swell cycles can impact foundations and lightly loaded slabs-on-grade when not designed for the anticipated expansive soil pressures. Expansive soils cause more damage to structures, particularly light buildings and pavements, than any other natural hazard, including earthquakes and floods (Jones and Holtz, 1973). Expansion potential may not manifest itself until months or years after construction. The potential for damage to slabs-on-grade and foundations supported on expansive soils can be reduced by placing non-expansive fill underlying foundations and slabs-on-grade.

In evaluation of the potential for expansive soils at the site, expansion index testing was performed on one (1) sample of the near surface silty sand soil samples from our 2022 preliminary geotechnical engineering investigation. The expansion index testing was performed in accordance with ASTM D4829 and the result is included in Appendix C of this report. The result of laboratory testing revealed an expansion index of 0, indicating very low expansion potential for the near surface granular soils. However, clay soils with medium plasticity were encountered as shallow as 3½ feet in one of the borings drilled during our 2022 preliminary geotechnical engineering investigation. In addition, the U.S.D.A. soil survey data identifies surface clays from the Joshua loam within parts of the eastern side of the site. Accordingly, expansive clays may be encountered within some areas of the site. Where expansive soils are encountered, appropriate mitigation measures should be used, such as placement of a granular fill capping the expansive soils to reduce the potential for excessive heave.

5.3.3 Soil Corrosion: The risk of corrosion of construction materials relates to the potential for soil-induced chemical reaction. Corrosion is a naturally occurring process whereby the surface of a metallic structure is oxidized or reduced to a corrosion product such as iron oxide (i.e., rust). The metallic surface is attacked through the migration of ions and loses its original strength by the thinning of the member.

Soils make up a complex environment for potential metallic corrosion. The corrosion potential of a soil depends on numerous factors including soil resistivity, texture, acidity, field moisture and chemical concentrations. In order to evaluate the potential for corrosion of metallic objects in contact with the onsite soils, chemical testing of soil samples was performed by Moore Twining as part of this report. The test results are included in Appendix C of this report. Conclusions regarding the corrosion potential of the soils tested are included in the Conclusions and Recommendations section of this report based on the severity ratings listed in Table No. 1, below.

Table No. 1
Corrosion Severity Ratings

Soil Resistivity (ohm cm)	Corrosion Potential Rating
>20,000	Essentially non-corrosive
10,000 - 20,000	Mildly corrosive
5,000 - 10,000	Moderately corrosive
3,000 - 5,000	Corrosive
1,000 - 3,000	Highly corrosive
<1,000	Extremely corrosive

The results of soil sample analyses from our 2022 preliminary geotechnical engineering investigation indicate that the near-surface soils tested exhibit a "highly corrosive" corrosion potential to buried metal objects.

If the manufacturers or suppliers cannot determine if materials are compatible with the soil corrosion conditions, a professional consultant, i.e., a corrosion engineer, with experience in corrosion protection should be consulted to provide design parameters. Moore Twining does not provide corrosion engineering services.

5.3.4 Sulfate Attack of Concrete from Soils: Degradation of concrete in contact with soils due to sulfate attack involves complex physical and chemical processes. When sulfate attack occurs, these processes can reduce the durability of concrete by altering the chemical and microstructural nature of the cement paste. Sulfate attack is dependent on a variety of conditions including concrete quality, exposure to sulfates in soil, groundwater and environmental factors. The standard practice for geotechnical engineers in evaluation of the soils anticipated to be in contact with structural concrete is to perform laboratory testing to determine the concentrations of sulfates present in the soils. The test results are then compared with the exposure classes in Table 19.3.1.1 of ACI 318 to provide guidelines for concrete exposed to soils containing sulfates. It should be noted that other exposure conditions such as seawater or dissolved sulfates in water or materials other than soils can result in sulfate exposure categories to concrete that are higher than the concentrations of sulfate in soil. The design engineer will need to determine whether other potential sources of sulfate exposure need to be considered other than exposure to sulfates in soil. The sulfate exposure classes for soils from Table 19.3.1.1 are summarized in the below table.

Table No. 2
ACI Exposure Categories for Water Soluble Sulfate in Soils

Sulfate Exposure Class (per ACI 318)	Water Soluble Sulfate in Soil (Percent by Mass)
S0	Less than 0.10 Percent
S1	0.10 to Less than 0.20 Percent
S2	0.20 to Less than or Equal to 2.00 Percent
S3	Greater than 2.00 Percent

Common methods used to resist the potential for degradation of concrete due to sulfate attack from soils include, but are not limited to the use of sulfate-resisting cements, air-entrainment and reduced water to cement ratios. The laboratory test results from our 2022 preliminary geotechnical engineering investigation are included in Appendix C of this report. Conclusions regarding these sulfate test results are included in the Conclusions section of this report.

5.3.5 Conditional Geologic Hazards: Conditional geologic hazards, as identified in Section 31 of California Geological Survey Note 48 are discussed in the following subsections.

5.3.5.1 Hazardous Materials: Hazardous materials such as hydrogen-sulfide gas and tar seeps are not known to be present in the project area and are not considered to be a concern at the subject site.

5.3.5.2 Volcanic Activity: California includes six regions with a history of late Pleistocene volcanic eruptions that are subject to hazards from future eruptions (Miller, 1989). Of these six regions, the Amboy Crater, Lavic Lake area is the closest region, with the Rodman Mountains area within this region being located about 30¼ miles southeast of the site. Based on review of Plate 1 (Miller, 1989), the subject site is not located within any designated volcanic hazard zones (such as flowage, pyroclastic flows, debris flows, or ash fall hazards). The closest volcanic hazard to the site is indicated to be tephra hazards associated with basalt or basalt-andesite vents from an eruption in the Rodman Mountains Area, impacting areas greater than 24 miles southeast of the subject site, as measured from near the Kane Wash area on the northwest side of the Rodman Mountains.

Based on the distance of volcanic hazards from the site, the prospect for volcanic hazards to impact the site during the design life of the facility is considered low.

5.3.5.3 Flooding: Based on the Flood Insurance Rate Maps distributed by the Federal Emergency Management Agency, in general, the majority of the site is located in Zone X. According to Community Panel number 06071C3915J revised on September 2, 2016, Zone X is defined as "Areas determined to be outside the 0.2 percent annual chance floodplain." Where mapped, the base flood elevation for the special flood hazard area for the Mojave River is an elevation of 2,182 feet and the closest edge of this flood plane is shown to be about 0.4 miles north/northwest of the site. This based flood elevation of 2,182 feet for the Mojave River is 10 feet lower than the lowest portion of the site in the northeast corner of the site. The special flood hazard area for the Lenwood Channel is about 0.3 miles southeast of the site.

A small portion of the western side of the site is mapped as being located in Zone D which is defined as "Areas in which flood hazards are undetermined, but possible." Considering some of the younger deposits, including the Young Mixed Alluvial and Eolian deposits (Qyae) and the Young Mojave River deposits, unit 3 (Qymr3), mapped in the western portion of the site, there is potential for short term flood hazards in the lower western portions of the site.

In addition, seasonal washes were noted in the western area of the site. Accordingly, there is a potential for concentrated runoff from these washes to induce localized flooding if they remain uncontrolled as part of development. Site grading and drainage design should be developed in a manner to ensure the drainage from the washes does not impact the proposed development.

The California Department of Water Resources, Division of Safety of Dams website (https://fmds.water.ca.gov/maps/damim/) was reviewed for potential inundation at the site from breaches of dams in the surrounding area. Based on review of this website, the site is not located inside any inundation zones for catastrophic failure. The Policy Map HZ-3 Dam & Basin Hazards from the October 27, 2020 San Bernardino County Draft Countywide Plan also shows that the site is not located inside any inundation zones for catastrophic failure. Although the Division of Safety of Dams website shows that the Cedar Springs Dam and New Lake Arrowhead Dam would inundate the Mojave River in the event of catastrophic failure, the inundation does not show that it would spread to the subject site.

5.3.5.4 Tsunamis and Seiches: Tsunamis are waves generated in oceans from seismic activity. Due to the inland location of the site (97 miles northeast of the Pacific Ocean), tsunamis are not considered a significant hazard for the site.

A seiche is a wave generated by the periodic oscillation of a body of water whose period is a function of the resonant characteristics of the containing basin as controlled by its physical dimensions. These periods generally range from a few minutes to an hour or more. The site is not located near any large bodies of water, so seiches are not considered a significant hazard at the site.

5.3.5.5 Radon Gas: Naturally occurring radon gas is known to occur in some areas of California. Radon gas can accumulate in buildings and breathing air with elevated radon concentrations results in an increased risk of developing lung cancer. Radon gas forms from radioactive decay of small amounts of the elements uranium and thorium, naturally present in rocks and soils. Rock types, such as black shales, marine phosphatic rocks, and certain igneous rocks, are associated with relatively higher levels of radon gas than other rock types. These rock types are not known to be present near the ground surface at the project site.

The U.S. EPA recommends that individuals avoid long-term exposure to radon concentrations above 4 picocuries per liter. Based on our review of a database maintained by the California Department of Public Health Services (CDPH) on the California Geologic Survey website, the California Indoor Radon Levels Sorted By Zip Code, last updated February 2017, indicates that 2 of the 45 radon tests (4.4 percent) conducted within the same zip code as the subject site (92311) reported radon gas levels that did not exceed 4 picocuries per liter.

Considering the geologic conditions of the site area, the referenced data reported by the CDPH, and assuming that the buildings will be properly ventilated, it is our opinion that potential hazards associated with radon gas are low.

5.3.5.6 Naturally Occurring Asbestos: Asbestos occurs in soil and rock naturally in certain geologic settings in California. It has been documented that inhalation of asbestos fibers may cause negative health effects. Most commonly, asbestos is associated with serpentinite and partially serpentized ultramafic rocks. Ultramafic rocks are scattered throughout much of the Sierra Nevada mountain and Coast Ranges regions. Review of the referenced Open-File Report 2000-19, titled *A General Location Guide for Ultramafic Rocks in California - Areas More Likely to Contain Naturally Occurring Asbestos,* prepared by State of California Department of Conservation, Division of Mines and Geology, dated August, 2000, indicates the closest occurrence of ultramafic rocks are located about 128 miles northwest of the site.

Ultramafic rocks were not encountered during our 2022 preliminary geotechnical engineering investigation, not observed during the geologic site reconnaissance, and are not common to the geologic environment of the site. Based on the cited literature and our site observations, it is our opinion that the potential to encounter surface or near surface naturally occurring asbestos containing rock at the site is low.

5.3.5.7 Hydrocollapse: Some soils in the desert regions of California can be susceptible to hydrocollapse. Soils that are relatively dry and exhibit cementation can be susceptible to hydrocollapse when wetted. However, granular soils exhibiting cementation were not encountered in the borings drilled at the site during our 2022 preliminary geotechnical engineering investigation. Consolidation tests were conducted on the near surface Holocene age Young Mojave River deposits (poorly graded sands with silt) from relatively undisturbed samples collected from the borings drilled

at the subject site in 2022. Two (2) of the three (3) tests were conducted on lean clay with sand and lean clay samples which exhibited negligible collapse potential. However, one (1) of the three (3) tests was conducted on a poorly graded sand with silt sample and indicated slight collapse potential (1.2 percent collapse when wetted under a load of 2 kips per square foot). This value (with up to 1 to 5 percent collapse) is considered "Moderate Trouble" based on Figure No. 6 within Section 6 of Chapter 1 from NAVFAC, DM7.01. Although there is a potential for disturbance of the samples to impact the hydrocollapse indicated by the laboratory test results, due to the nature of the deposits and our experience, this report considers that the near surface granular soils tested are susceptible to hydrocollapse. It is anticipated that the near surface soils may be susceptible to hydrocollapse.

Thus, over-excavation and compaction of the near surface soils will likely be needed to reduce the potential for excessive hydrocollapse for structures in areas where soils are subject to collapse potential. Accordingly, impacts to structures as a result of hydrocollapse are anticipated to be low after the appropriate site preparation is conducted.

5.3.5.8 Regional Subsidence: An online map (https://ca.water.usgs.gov/land_subsidence/california-subsidence-areas.html), "Areas of Land Subsidence in California," on a USGS website, indicates that the Barstow and Lenwood areas are not located in a mapped subsidence area for groundwater pumping, peat loss or oil extraction. Thus, regional subsidence is not considered a concern for this project.

5.3.5.9 Clays and Cyclic Softening: Clay soil layers were encountered in some of the borings drilled during our 2022 preliminary geotechnical engineering investigation. However, based on the depth to groundwater and the very stiff to hard nature of the sandy lean clays, lean clays with sand, and lean clays encountered, cyclic softening of clays is not anticipated to be a hazard.

5.4 Seismic Hazards: The potential for fault ground rupture, seismic groundshaking and seismic coefficients/earthquake spectral response acceleration design values, and liquefaction and seismic settlement are described in the following subsections.

5.4.1 Active Faulting and Surface Fault Rupture: Earthquakes are caused by the sudden displacement of earth along faults with a consequent release of stored strain energy. The fault slippage can often extend to the ground surface where it manifests in abrupt relative ground displacement across a rupture surface. Damage resulting directly from fault rupture ground displacement occurs only where structures are located astride a rupture surface with relative displacement.

The project site is not located in an Alquist-Priolo Earthquake Fault Zone mapped by the California Geological Survey, nor a San Bernardino County designated fault zone (based on the San Bernardino County Land Use Plan, Geologic Hazard Overlays).

The locations of active faults near the site were evaluated based on the Fault Activity Map of California: California Geological Survey, Geologic Data Map No. 6, prepared by Jennings and Bryant. The Fault Activity Map of California identifies an active, creeping segment of the Lenwood-Lockhart fault zone (Lenwood fault) mapped in close proximity southeast of the southeastern corner of the site. This shallow linear swale and segment of the Lenwood fault was identified offsite, beginning about 300 feet east of the southeast corner of the subject site. The location of this feature is shown on Photograph Nos. 5 and 6 in Appendix E of this report.

A map depicting the major active faults in the vicinity of the site is included on Drawing No. 4 in Appendix A of this report. In addition, a closeup map of the site showing the Lenwood-Lockhart fault zone is shown on Drawing No. 3 in Appendix A of this report. Detailed descriptions of the Lenwood-Lockhart fault zone from published literature is included in section 4.2 of this report.

The nearest mapped, active fault with traditional surface rupture is a section of the Lenwood-Lockhart fault zone (Lenwood fault) further southeast of the site, about 2.2 miles from the site. These nearby segments of the Lenwood fault were observed and discussed in detail in the Geologic Site Reconnaissance (Section 4.3) of this report. Refer also to Photograph Nos. 1 through 4 in Appendix E of this report.

A concealed, potentially active fault (Lockhart fault) associated with the Lenwood-Lockhart fault zone is mapped about 1 mile to the northwest where it trends across the Mojave River.

The approximate locations of these fault sections are shown on Drawing Nos. 3 and 4 in Appendix A of this report, and the offsite, shallow linear swale and segment of the Lenwood fault directly east of the southeast corner of the site and extending further to the southeast is also shown on Drawing No. 7 in Appendix A of this report based on site observations during the geologic site reconnaissance. The nearby faults shown on the U.S. Quaternary Fault map prepared by the United States Geological Survey are similar to the faults shown on the Fault Activity Map of California.

The geologic site reconnaissance discussed in Section 4.3 of this report indicated that there was no evidence of faulting noted at the ground surface across the subject site. Based on the literature reviewed regarding the Lenwood-Lockhart fault zone and the geologic site reconnaissance discussed in this report, since active faults are not mapped within the site and were not observed at the subject site, the potential for surface rupture due to a known active fault appears to be low. However, potential impacts from the adjacent Lenwood fault section are recommended to be evaluated if a future structure is planned within a hypothetical northwest extension of the Lenwood fault section within the limits shown on Drawing No. 3 in Appendix A of this report.

5.4.2 Groundshaking: For any given earthquake, the rock in the immediate vicinity will respond with a certain maximum acceleration and with a predominant period that depends on the nature of the rock and the source mechanism. Away from the focus of the earthquake, the ground motions begin to attenuate. The way in which the earthquake wave is altered depends to a great degree on source characteristics and to a lesser degree on the travel path.

A summary of our review of historic seismic activity relative to the site is included below.

5.4.2.1 Historic Seismic Activity: The general site region has experienced recurring seismic activity. Based on historical earthquake data obtained from the U.S. Geological Survey's earthquake database system, approximately 64 historical earthquakes with magnitude 4.5 or greater have been recorded from 1900 through May 21, 2024, within about 50 miles of the site. A map showing the location of the project site with relation to the approximate historical earthquake epicenter locations and magnitude category is presented on Drawing No. 6 in Appendix A of this report.

The nearest earthquake event (estimated magnitude of 4.8) found during the search occurred on August 5, 1992, approximately 11¼ miles northeast of the site. The nearest earthquake event also had the highest peak horizontal ground acceleration at the subject site (0.092g). The largest magnitude earthquake identified within the 50 mile radius search at the site resulting from the historic earthquakes both occurred during the 6.5 magnitude Manix earthquake (0.086g) which also occurred on April 10, 1947, along the Manix fault, located approximately 33¾ miles northeast of the site. However, it should be noted that the 7.3 magnitude Landers earthquake (discussed in section 4.2 of this report) occurred on June 28, 1992 just outside the search radius (about 61 miles southeast of the site) and had a peak horizontal acceleration of about 0.135g based on the peak ground acceleration shown in the Barstow area on the Shake-Map.

5.4.2.2 Design Seismic Ground Motion Parameters and Site Class: Seismic coefficients and spectral response acceleration values were developed for design as required by the 2022 California Building Code (CBC). The CBC methodology for determining design ground motion values is based on U.S Geological Survey seismic hazard maps, which incorporate both probabilistic and deterministic seismic ground motion.

The site is classified as a stiff soil (Site Class D) site with standard penetration resistance, N-values averaging between 15 and 50 blows per foot for the upper 100 feet BSG.

A Maximum Considered Earthquake (geometric mean) peak ground acceleration adjusted for site effects (PGA_M) of 0.604g was determined for the site using the Ground Motion Parameter Calculator provided by the Structural Engineers Association of California website (https://seismicmaps.org/).

The following mapped seismic factors were developed for the site using the Ground Motion Parameter Calculator provided by SEOAC and OSHPD (http://seismicmaps.org), based upon a site latitude of 34.890243 degrees and a site longitude of -117.114299 degrees. The data provided in

Table No. 3 are based upon the procedures of the 2022 California Building Code, ASCE 7-16 and Supplement No. 1 to ASCE 7-16. The data in Table No. 3 were not determined based upon a ground motion hazard analysis. If required, Moore Twining should be notified and requested to conduct the additional analysis, develop updated seismic factors for the project, and update the following values.

Table No. 3
Seismic Factors

Seismic Factor	2022 CBC Value*
Site Class	D
Maximum Considered Earthquake (geometric mean) peak ground acceleration adjusted for site effects (PGA_M)	0.604
Mapped Maximum Considered Earthquake (geometric mean) peak ground acceleration, (PGA)	0.549
Spectral Response At Short Period (0.2 Second), Ss	1.248
Spectral Response At 1-Second Period, S_1	0.436
Site Coefficient (based on Spectral Response At Short Period), Fa	1.001
Site Coefficient (based on spectral response at 1-second period) Fv	see note
Maximum considered earthquake spectral response acceleration for short period, S_{MS}	1.249
Maximum considered earthquake spectral response acceleration at 1 second, S_{M1}	see note
Five percent damped design spectral response accelerations for short period, S_{DS}	0.833
Five percent damped design spectral response accelerations at 1-second period, S_{D1}	see note

Note 1: Requires ground motion hazard analysis per ASCE Section 21.2 (ASCE 7-16, Section 11.4.8), unless the structural engineer determines that an exception of Section 11.4.8 of ASCE 7-16 is applicable for the project design.

* The above data is subject to the disclaimers listed in the website https://seismicmaps.org/

5.4.3 Liquefaction and Seismic Settlement: Liquefaction and seismic settlement are conditions that can occur under seismic shaking from earthquake events. Liquefaction describes a phenomenon in which a saturated, cohesionless soil loses strength during an earthquake as a result of induced shearing strains. Lateral and vertical movements of the soil mass, combined with loss of bearing usually results. Fine, well sorted, loose sand, shallow groundwater conditions, higher intensity earthquakes, and particularly long duration of ground shaking are the requisite conditions for liquefaction.

Due to the depth to groundwater at the site, liquefaction is not considered a potential impact to site development. Liquefaction and seismic settlement analyses were conducted based on soil properties revealed by boring B-2 (drilled to 35½ feet BSG) in accordance with the NCEER methods (Youd, et al.) using the computer program LiquefyPro, developed by CivilTech Software. A Maximum Considered Earthquake (geometric mean) peak ground acceleration adjusted for site effects (PGA_M) of 0.604g was determined for the site using the Ground Motion Parameter Calculator provided by SEOAC and OSHPD (http://seismicmaps.org). A Maximum Considered Earthquake magnitude of 7.45 was applied in the analysis based on deaggregation analysis (United States Geological Survey deaggregation website, Dynamic Conterminous U.S. 2014, Update). A groundwater depth of 51 feet was used for the analysis based on historical groundwater data from a nearby well.

The liquefaction analysis indicates that the sandy silt soils encountered from 10 to 15 feet BSG and the poorly graded sands encountered from 30 to 35 feet BSG from boring B-2 would be subject to dry seismic settlement. The results indicate that there is potential for seismic induced settlement of damp to dry sandy soils as a result of the design level seismic event (such as those encountered at the location of borings B-2 and B-3). The results of the analyses indicate total seismic settlements would be about ¾ inch. This magnitude of seismic settlement is not typically considered a concern for the type of structures contemplated at the site.

6.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the findings of this geologic-seismic hazards investigation, the following conclusions were prepared.

6.1 Based on the findings of this investigation, the site is considered suitable for the proposed development from a geologic standpoint. Based on our review of stereo pair aerial photographs and the geologic site reconnaissance, evidence of faulting along the Lenwood fault was indicated southeast of the subject site where an active portion of the fault had been mapped by the U.S. Geological Survey and California Geological Survey, but no evidence of active faulting was found within the subject site. However, potential impacts from the adjacent Lenwood fault section are recommended to be evaluated by subsurface fault exploration if a future structure is planned within a hypothetical northwest extension of the Lenwood fault section within the limits shown on Drawing No. 3 in Appendix A of this report. Based on our review of other potential geologic and seismic hazards, no other significant potential hazards were identified, with exception of the potential short term flood hazards expansive soils, and the potential for collapsible soils as noted below.

6.2 A small portion of the western side of the site is mapped as being located in Zone D which is defined as "Areas in which flood hazards are undetermined, but possible." Considering some of the younger deposits, including the Young Mixed Alluvial and Eolian deposits (Qyae) and the Young Mojave River deposits, unit 3 (Qymr3), mapped in the western portion of the site, there is potential for short term flood hazards in the lower western portions of the site. A civil engineer would need to evaluate the site elevations and drainage ways in order to determine the measures required to address flood hazards for the site development. In addition, there is a potential for concentrated runoff from the washes to induce localized flooding if they remain as uncontrolled drainage as part of development. Site grading and drainage design should be developed in a manner to ensure the drainage from the washes does not impact the proposed development.

6.3 Clay soils with medium plasticity were encountered as shallow as 3½ feet in one of the borings drilled during our 2022 preliminary geotechnical engineering investigation. In addition, the U.S.D.A. soil survey data identifies surface clays from the Joshua loam within parts of the eastern side of the site. Accordingly, expansive clays may be encountered within some areas of the site. Where expansive soils are encountered, appropriate mitigation measures should be used, such as placement of a granular fill capping the expansive soils to reduce the potential for excessive heave in accordance with the recommendations of a geotechnical engineering investigation.

6.4 The near surface soils may be susceptible to hydrocollapse. Thus, over-excavation and compaction of the near surface soils will likely be needed to reduce the potential for excessive hydrocollapse for structures in areas where soils are subject to collapse potential. The subgrade soils should be prepared in accordance with recommendations from a geotechnical engineering investigation. Accordingly, impacts to structures as a result of hydrocollapse are anticipated to be low after the appropriate site preparation is conducted.

6.5 Exposed beds of volcanic rock of the Barstow Formation were noted during the geologic site reconnaissance along the top of four (4) different ridges at the site where strike and dip bedding attitudes were measured and noted on Drawing No. 7 in Appendix A of this report and also on Photograph No. 17 in Appendix E of this report. The interpreted volcanic rock areas are shown in general on the cross sections included as Drawing Nos. 8 and 9 in Appendix A of this report. The volcanic rock is anticipated to be difficult to excavate and anticipated to break up into oversize pieces of rock when excavated. Specialized equipment and methods would be anticipated to excavate the volcanic rock materials. In addition, oversize rock would need to be reduced in size in order to be reused as engineered fill for the proposed development.

6.6 Based on the corrosion severity ratings shown in Table No. 1, the soils tested from our 2022 preliminary geotechnical engineering investigation exhibit a “highly corrosive” corrosion potential. Therefore, buried metal objects should be protected in accordance with the manufacturer's recommendations based on a “highly corrosive” corrosion potential. The evaluation was limited to the effects of soils to metal objects; corrosion due to other potential sources, such as stray currents and groundwater, was not evaluated. If piping or concrete are placed in contact with deeper soils or engineered fill, these soils should be analyzed to evaluate the corrosion potential of these soils. Additional laboratory testing should be performed during a design level geotechnical engineering investigation.

6.7 Based on the laboratory testing from our 2022 preliminary geotechnical engineering investigation for soluble sulfates in soil, the results indicate an exposure category S0 in accordance with Table 19.3.1.1 of ACI 318, with a low potential for sulfate attack on concrete.

7.0 NOTIFICATION AND LIMITATIONS

7.1 The conclusions and recommendations presented in this report are based on our evaluation of the geologic and seismic hazards and the results of the field and laboratory investigation from our 2022 preliminary geotechnical engineering investigation.

7.2 This report presents the results of a geologic/seismic hazards investigation only and should not be construed as a geotechnical engineering investigation or an environmental audit or study. As noted in this report, when site plan is developed identifying the locations and type of structures planned for the project, this information should be provided to Moore Twining in order to develop a scope of work and estimate for a design level geotechnical investigation.

7.3 The conclusions contained in this report are valid only for the project discussed in the Background Information section of this report. The use of the information contained in this report for structures on this site not discussed herein or for structures on other sites not discussed in this report is not recommended. The entity or entities that use or cause to use this report or any portion thereof for another structure or site not covered by this report shall hold Moore Twining, its officers and employees harmless from any and all claims and provide Moore Twining's defense in the event of a claim.

7.4 This report is issued with the understanding that it is the responsibility of the client to transmit the information and conclusions and recommendations in this report to developers, owners, buyers, architects, engineers, designers, contractors, subcontractors, and other parties having interest in the project so that the steps necessary for consideration in the design, construction and maintenance of the project are taken by the appropriate party.

7.5 Our professional services were performed, our findings obtained, and our conclusions and recommendations were prepared in accordance with generally-accepted engineering principles and practices. This warranty is in lieu of all other warranties either expressed or implied.

7.6 Reliance on this report by a third party (i.e., that is not a party to our written agreement) is at the party's sole risk. If the project and/or site are purchased by another party, the purchaser must obtain written authorization and sign an agreement with Moore Twining in order to rely upon the information provided in this report for design or construction of the project.

8.0 CLOSING

We appreciate the opportunity to be of service. If you have any questions regarding this report, or if we can be of further assistance, please contact us at your convenience.

Sincerely,
MOORE TWINING ASSOCIATES, INC.
Geotechnical Engineering Division

MIXED ALLUVIAL-FAN AND EOLIAN DEPOSITS

Qyae **Young mixed alluvial and eolian deposits (Holocene to latest Pleistocene)**—Deposit consists of alluvial and eolian sediments that are thoroughly mixed. These units are found mainly in the northeastern part of the map area, where significant eolian contribution stems from Harper Lake and local playas. Deposits are moderately sorted to well-sorted sand and gravel. Sediments are typically loose. Soil development and desert pavement are similar to or less pronounced than that exhibited by correlative alluvial-fan units. Deposits form more muted topographic surfaces than alluvial-fan surfaces lacking significant eolian sand. Surfaces are sparsely vegetated, generally supporting creosote bush, white bursage, and perennial grasses. Deposits grade complexly toward eolian-sand sources by increase of sand component and decrease of discrete alluvial beds

Qymr3 **Young Mojave River deposits, unit 3 (middle Holocene)**—Arkosic gravel, sand, and silt with reddish quartzite pebbles. Well bedded with typical fluvial stream-deposit characteristics, such as normal grading, cross-beds, and less common crevasse splay and floodplain sediment. Deposit displays bar and swale topography, lies 1–2 m above modern river channel elevation

MIOCENE SEDIMENTARY ROCK

Tb **Barstow Formation (Miocene)**—Sandstone, siltstone, and limestone in the Mud Hills area of the type Barstow Formation (MacFadden and others, 1990). Consists of sandstone, siltstone, limestone, and minor volcanic rocks near Lenwood. Rocks in type section are older than 19 Ma to as young as ~14 Ma (MacFadden and others, 1990)

APPENDIX B

LOGS OF BORINGS
FROM 2022 PRELIMINARY GEOTECHNICAL ENGINEERING INVESTIGATION

This appendix contains the final logs of borings. These logs represent our interpretation of the contents of the field logs and the results of the field and laboratory tests.

The logs and related information depict subsurface conditions only at these locations and at the particular time designated on the logs. Soil conditions at other locations may differ from conditions occurring at these test boring locations. Also, the passage of time may result in changes in the soil conditions at these test boring locations.

In addition, an explanation of the abbreviations used in the preparation of the logs and a description of the Unified Soil Classification System are provided at the end of Appendix B.

	California Modified split barrel ring sampler
	Bulk/Grab sample

Notes:

1. Exploratory borings were drilled on June 30, 2022 using a CME 75 drill rig equipped with 6-5/8 inch outside diameter hollow stem augers.

2. Groundwater was not encountered.

3. Boring locations were measured or paced from existing features.

4. These logs are subject to the limitations, conclusions, and recommendations in this report.

5. The "N-Value" reported for the California Modified Split Barrel Sampler is the uncorrected field blow count. This value should not be interpreted as an SPT equivalent N-Value.

6. Results of tests conducted on samples recovered are reported on the logs.

DD =	Natural dry density (pcf)	LL =	Liquid Limit (%)

APPENDIX C

RESULTS OF LABORATORY TESTS FROM 2022 PRELIMINARY GEOTECHNICAL ENGINEERING INVESTIGATION

This appendix contains the individual results of the following tests. The results of the moisture content and dry density tests are included on the test boring logs in Appendix B. These data, along with the field observations, were used to prepare the final test boring logs in Appendix B.

These Included:	**To Determine:**
Moisture Content (ASTM D2216)	Moisture contents representative of field conditions at the time the sample was taken.
Dry Density (ASTM D2937)	Dry unit weight of sample representative of in-situ or in-place undisturbed condition.
Grain-Size Distribution (ASTM D422)	Size and distribution of soil particles, i.e., sand, gravel and fines (silt and clay).
Atterberg Limits (ASTM D4318)	Determines the moisture content where the soil behaves as a viscous material (liquid limit) and the moisture content at which the soil reaches a plastic state
Expansion Index (ASTM D4829)	Swell potential of soil with increases in moisture content.
Consolidation (ASTM 2435)	The amount and rate at which a soil sample compresses when loaded, and the influence of saturation on its behavior.
R-Value (ASTM 2844)	The capacity of a subgrade or subbase to support a pavement section designed to carry a specified traffic load.
Sulfate Content (Cal Test 417)	Percentage of water-soluble sulfate as (SO4) in soil samples. Used as an indication of the relative degree of sulfate attack on concrete and for selecting the cement type.
Chloride Content (Cal Test 422)	Percentage of soluble chloride in soil. Used to evaluate the potential attack on encased reinforcing steel.
Resistivity (ASTM G187)	The potential of the soil to corrode metal.
pH (Cal Test 643)	The acidity or alkalinity of subgrade material.

RE: Electric Charging Station & Travel Center

Enclosed are the analytical results for samples received by our laboratory on **07/07/22** . For your reference, these analyses have been assigned laboratory work order number **IG07028**.

All analyses have been performed according to our laboratory's quality assurance program. All results are intended to be considered in their entirety, Moore Twining Associates, Inc. (MTA) is not responsible for use of less than complete reports. Results apply only to samples analyzed.

If you have any questions, please feel free to contact us at the number listed above.

Sincerely,

Moore Twining Associates, Inc.

Lauren Cox

Notes and Definitions

µg/L	micrograms per liter (parts per billion concentration units)
mg/L	milligrams per liter (parts per million concentration units)
mg/kg	milligrams per kilogram (parts per million concentration units)
ND	Analyte NOT DETECTED at or above the reporting limit
RPD	Relative Percent Difference

Analysis of pH, filtration, and residual chlorine is to take place immediately after sampling in the field.
If the test was performed in the laboratory, the hold time was exceeded. **(for aqueous matrices only)**

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Settlement of Unsaturated Sands=0.565 in.
dsz is per each segment, dz=0.05 ft
dsp is per each print interval, dp=1.00 ft
S is cumulated settlement at this depth

Total Settlement of Saturated and Unsaturated Sands=0.565 in.

Units: Unit: qc, fs, Stress or Pressure = atm (1.0581tsf); Unit Weight = pcf; Depth = ft; Settlement = in.

1 atm (atmosphere) = 1.0581 tsf(1 tsf = 1 ton/ft2 = 2 kip/ft2)
1 atm (atmosphere) = 101.325 kPa(1 kPa = 1 kN/m2 = 0.001 Mpa)

SPT	Field data from Standard Penetration Test (SPT)
BPT	Field data from Becker Penetration Test (BPT)
qc	Field data from Cone Penetration Test (CPT) [atm (tsf)]
fs	Friction from CPT testing [atm (tsf)]
Rf	Ratio of fs/qc (%)
gamma	Total unit weight of soil
gamma'	Effective unit weight of soil
Fines	Fines content [%]
D50	Mean grain size
Dr	Relative Density
sigma	Total vertical stress [atm]
sigma'	Effective vertical stress [atm]
sigC'	Effective confining pressure [atm]
rd	Acceleration reduction coefficient by Seed
a_max.	Peak Ground Acceleration (PGA) in ground surface
mZ	Linear acceleration reduction coefficient X depth
a_min.	Minimum acceleration under linear reduction, mZ
CRRv	CRR after overburden stress correction, CRRv=CRR7.5 * Ksig
CRR7.5	Cyclic resistance ratio (M=7.5)
Ksig	Overburden stress correction factor for CRR7.5
CRRm	After magnitude scaling correction CRRm=CRRv * MSF
MSF	Magnitude scaling factor from M=7.5 to user input M
CSR	Cyclic stress ratio induced by earthquake
CSRfs	CSRfs=CSR*fs1 (Default fs1=1)
fs1	First CSR curve in graphic defined in #9 of Advanced page
fs2	2nd CSR curve in graphic defined in #9 of Advanced page
F.S.	Calculated factor of safety against liquefaction F.S.=CRRm/CSRsf
Cebs	Energy Ratio, Borehole Dia., and Sampling Method Corrections
Cr	Rod Length Corrections
Cn	Overburden Pressure Correction
(N1)60	SPT after corrections, (N1)60=SPT * Cr * Cn * Cebs
d(N1)60	Fines correction of SPT
(N1)60f	(N1)60 after fines corrections, (N1)60f=(N1)60 + d(N1)60
Cq	Overburden stress correction factor
qc1	CPT after Overburden stress correction
dqc1	Fines correction of CPT
qc1f	CPT after Fines and Overburden correction, qc1f=qc1 + dqc1
qc1n	CPT after normalization in Robertson's method
Kc	Fine correction factor in Robertson's Method
qc1f	CPT after Fines correction in Robertson's Method
Ic	Soil type index in Suzuki's and Robertson's Methods
(N1)60s	(N1)60 after settlement fines corrections
CSRm	After magnitude scaling correction for Settlement calculation CSRm=CSRsf / MSF*
CSRfs	Cyclic stress ratio induced by earthquake with user inputed fs
MSF*	Scaling factor from CSR, MSF*=1, based on Item 2 of Page C.
ec	Volumetric strain for saturated sands
dz	Calculation segment, dz=0.050 ft
dsz	Settlement in each segment, dz
dp	User defined print interval
dsp	Settlement in each print interval, dp
Gmax	Shear Modulus at low strain
g_eff	gamma_eff, Effective shear Strain
g*Ge/Gm	gamma_eff * G_eff/G_max, Strain-modulus ratio
ec7.5	Volumetric Strain for magnitude=7.5
Cec	Magnitude correction factor for any magnitude
ec	Volumetric strain for unsaturated sands, ec=Cec * ec7.5
NoLiq	No-Liquefy Soils

APPENDIX E

PHOTOGRAPH LOG

Photograph No. 1: Viewing southeast along the trace of the Lenwood fault on the south side of the Interstate 15 freeway. Clipboard placed along the trace of the fault.

Photograph No. 2: Viewing northwest along the trace of the Lenwood fault on the south side of the Interstate 15 freeway. Soil with coarse gravel, cobbles and boulders with very little sparse grasses vegetation growth are shown on the northeast side of the fault while the southwest side of the fault includes soil with fine gravel and abundant dried grasses vegetation growth.

Photograph No. 3: Viewing southeast along the trace of the Lenwood fault on the south side of the Interstate 15 freeway.

Photograph No. 4: Viewing in a southwest direction on the south side of the Interstate I-15 freeway, perpendicular to the Lenwood fault, where offset of a drainage was observed along the trace of the Lenwood fault. Drainage shows a few feet of right-lateral strike-slip offset from the Lenwood fault.

Photograph No. 5: Viewing northwest along shallow linear swale on the right side of an unpaved dirt road. This linear swale was mapped by others as being an active trace of the Lenwood fault. Sandstone on left side of the fault trace is absent on the right side of the fault trace (linear swale).

Photograph No. 6: Viewing southeast (opposite direction of picture above) along linear swale on the left of unpaved dirt road. Sandstone shown on right side of the Lenwood fault trace is absent on the left side of the fault trace (linear swale).

Photograph No. 7: Viewing west from southeast corner of subject site while standing on elevated ridge of volcanic rocks.

Photograph No. 8: Viewing north from southeast corner of subject site while standing on elevated ridge of volcanic rocks.

Photograph No. 9: Viewing east along top of S-shaped ridge in southeastern portion of the subject site where bedding planes of steeply dipping volcanic rocks were observed. This volcanic bed dipped down about 50 degrees to the south.

Photograph No. 10: Viewing west (opposite direction of picture above) at another bedding plane of steeply dipping volcanic rocks. Two distinct layers of steeply dipping volcanic rock were noted along the top of the S-shaped ridge and followed the shape of the ridge. Where the clipboard is shown, this volcanic bed dipped down about 43 degrees to the south. No evidence of offset of the steeply dipping volcanic beds was observed that would be indicative of faulting at the ground surface.

Photograph No. 11: Viewing east along S-shaped ridge where bedding plane of volcanic rock dipping down about 38 degrees to the south was observed in south-central portion of the subject site.

Photograph No.12: Viewing north at a second ridge of volcanic rock that is about 475 feet north of the first ridge shown in Photograph Nos. 9 through 11. This ridge also had volcanic rock that trended east to west along the top of the ridge and dipped down 58 degrees to the south. No evidence of offset of the steeply dipping volcanic beds was observed that would be indicative of faulting at the ground surface.

Photograph No. 13: Viewing west along a third ridge of volcanic rock dipping down 77 degrees to the south with spray painted graffiti and located in the central-eastern portion of the site. No evidence of faulting of this steeply dipping volcanic bed was observed.

Photograph No. 14: Viewing west along the south side of a fourth ridge of steeply dipping volcanic rock located in the northern portion of the site. Unlike most areas of the site, the volcanic beds along the south side of this ridge dipped down 56 to 65 degrees to the north.

Photograph No. 15: Viewing west along the north side of the fourth ridge of steeply dipping volcanic rock located in the northern portion of the site. These beds dipped 80 degrees to the south. No evidence of faulting of the steeply dipping volcanic beds was observed along this fourth ridge.

Photograph No. 16: Viewing east from the central-western portion of the site. Areas of the site lower in elevation were either covered by sand and scattered gravel-size pieces of rock or by eolian 'dune-like" fine-grained sands as shown in the photograph above. No evidence of faulting was observed along the ground surface in any of the areas of the site lower in elevation.

Photograph No. 17: Google Earth aerial image from 2009 showing strike and dip bedding attitudes recorded along bedding planes of volcanic rock along the top of four different ridges and linear swale noted along an active portion of the Lenwood fault.

Re: Fault Rupture Hazard Investigation Report
Lenwood Road Logistics Facility
North of Camino del Norte, East of Lenwood Road
Barstow, California
Terracon Project No. CB255099

Dear Mr. DiSabatino:

We have completed the scope of Fault Rupture Hazard Investigation services for the above referenced project in general accordance with a revised proposal dated July 1, 2025. This report presents the findings of the subsurface exploration and provides a summary of findings regarding fault rupture potential for the proposed project. Our investigation found that the project is not affected by potentially hazardous fault traces and may be developed as proposed.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning this report or if we may be of further service, please contact us.

Sincerely,

Terracon

Introduction

This report presents the results of fault trench excavation and logging performed to address the potential for fault rupture hazard at a proposed logistics project site located in Barstow, San Bernardino County, California.

The project is located north of Camino del Norte and east of Lenwood Road approximately ½ mile north of Main Street. State Route 58 is approximately 1.6 miles north of the site. The site area is approximately 96 acres.

A consultant's report (Moore Twining, 2024) postulated a projection of mapped faulting toward the site and recommended further study for habitable structures planned within a hypothetical northwest zone of projection. Exploration of the projected fault trend within the southeastern portion of the site is the subject of this report.

The subject fault feature is listed in the pamphlet to accompany California Geologic Survey Fault Activity Map of California (2010) as #375, 'Lenwood Fault Creep'. It also appears on the web-based application https://maps.conservation.ca.gov/cgs/fam/ that is a digitized version of the Fault Activity Map.

The site is not within a State-designated fault hazard zone (AP Fault Zone Map) or County-designated fault zone (County Fault Map).

We referenced the following documents in developing the scope of this investigation:

- County of San Bernardino Fault-Rupture Hazard Investigation and Report Standards No. A-146.
- California Geological Survey Special Publication 42, Earthquake Fault Zones, A Guide for Government Agencies, Property Owners/Developers, and Geoscience Practitioners for Assessing Fault Rupture Hazards in California (2018).
- California Geological Survey Note 49, Guidelines for Evaluating and Mitigating Seismic Hazards in California (2002).

We excavated and logged fault trenches oriented perpendicular to the projection of the mapped fault feature to evaluate the presence/absence of hazardous faults associated with the mapped fault zone (see Trench Location Map).

Scope of Services

Our scope of services, as outlined in the revised proposal dated July 1, 2025 included the following:

- We examined available aerial imagery dating back to the 1920s, including false-color frames
- We examined LiDAR imagery from https://apps.nationalmap.gov/3depdem/.
- We reviewed geologic maps and reports for information regarding faults associated with the mapped fault zone identified in the Moore Twining (2024) report
- Dudek marked site limits and notified Underground Service Alert of southern California for utility clearance
- We directed excavation of two exploratory trenches located to intercept the projected trend of faulting identified on the consultant's and original source map, cleaned, and logged the trenches
- We notified the authorizing agency (County of San Bernardino Land Use Services) prior to backfilling the trench exposure. Agency representatives visited the site on July 25, 2025 to examine the open trench
- We prepared this report

Maps showing the site location and trench locations are attached as Site Location and Trench Location Map, respectively. An AP Fault Zone Map showing the site in relation to State-designated fault hazard zones is attached. A County Fault Map showing the site relative to County-designated fault zones is also included.

Geologic Setting

The site is located in an unincorporated area of Barstow, California on the northwest flank of a broad regional uplift that exposes sedimentary rocks. The uplift lies within the Mojave Desert Geomorphic Province, a region of broad alluviated basins receiving sediments from adjacent uplands. The normally dry channel of the Mojave River forms a sandy flatland with associated dune features northwest of the site.

The subject fault feature lies within a zone of transition between the Lenwood and Lockhart faults that is covered by young alluvium of the Mojave River and deposits of a low-lying valley. The Lenwood-Lockhart fault zone (LLFZ) is one of a series of northwest-trending strike slip faults that comprise the Eastern California Shear Zone (ECSZ) - a zone of subparallel, right-lateral strike slip faults estimated to accommodate up to 25% of Pacific/North American Plates slip. The ECSZ is associated with historical earthquakes including the magnitude 7.3 Landers and magnitude 7.1 Hector Mine events in 1992 1999, respectively. A Regional Fault Map showing the site location in relation to regional faults is attached.

Based on geologic mapping by Miller and others (2020), the geologic materials beneath the trench site consist of sedimentary beds of the Barstow Formation (see Geologic Map 1). Geologic mapping by Dibblee and Minch (2008) provides greater detail of bedding and describes site materials as: (Ts) interbedded shale and sandstone (Pliocene); (Tsl) limestone, tan, hard (Pliocene); and (Trb) rhyolite breccia (Miocene).

As encountered in trench exposures, the Barstow Formation includes massive to locally well-bedded arkosic fine-grained sandstone with minor siltstone beds and well-bedded siltstone with coarse-grained sandstone intervals. All of the clastic materials are derived from volcanic sources with siltstone and localized claystone beds appearing lacustrine in origin. Arcuate ridgelines within the site are formed by resistant limestone beds within the Barstow Formation. Examination of the ridgelines revealed tan limestone beds with siliceous lenses (locally chert). Bedding is consistently southwest-dipping at moderate to locally steep angles.

Review of Published Data and Maps

- Morton, D.M., Miller, F.K., and Smith, C.C., 1980, Photoreconnaissance Maps Showing Young-Looking Fault Features in the Southern Mojave Desert, California, U.S. Geological Survey Miscellaneous Field Studies Map MF-1051, Sheets 1 and 2 of 7.
- U.S. Geological Survey, U.S. Quaternary Faults, web-based map application, https://usgs.maps.arcgis.com/apps/webappviewer/index.html?id=5a6038b3a1684561a9b0aadf88412fcf.

The U.S. Quaternary Faults map application includes the fault trend projected toward the southeast portion of the site parcel (labeled as ‘shallow linear swale’). The original source of this mapped trace appears to be the Morton and others (1980) map, sheet 2. Morton and others based their work on examination of aerial imagery and did not field check their map.

The 1980 Morton map labels a northwest-trending fault as ‘shallow linear swale’ and is included in FER 177 (Manson, 1986) with annotations describing features within a housing tract south of Main Street and southeast of the site. Offset and cracked walls/street features and building damage are noted. Manson (1986) states in FER 177 that evidence of possible fault creep (damage to housing tract) in Lenwood was examined in the field but could not be verified as being fault-related. The Barstow quadrangle topographic map panel that includes the site and projected fault (shallow linear swale) was not recommended for zoning per the conclusions of Manson (1986).

FER 189 (Bryant, 1987) utilized a geologic base map by Dibblee (1960) to summarize fault features associated with the Lockhart fault near Barstow. An inferred/buried fault trace is shown by Dibblee trending beyond (outside of) the northeast corner of the site parcel. No feature is included in FER 189 that corresponds with the ‘shallow linear swale’ feature identified by Morton and others (1980).

Aerial Photographs

Aerial imagery dating from 1929 through 2024 was examined for evidence of faulting and past land usage for this investigation. A list of aerial imagery is attached. The following were noted in the imagery examined:

- The greater project parcel appears undeveloped and sparsely vegetated in all imagery.
- Vehicle tracks and paths are visible within the parcel
- A prominent set of arcuate ridgelines are visible in the southern portion of the parcel that correspond with resistant bedrock outcrops (limestone) observed during site reconnaissance.
- Tonal, topographic, or vegetative lineaments were not noted along or near the trend of the 'shallow linear swale' feature indicated by Morton and others (1980) southeast of the site.
- Development of the residential tract south of the site is evident after September 1995.

Evidence for faults or fault-related features was not observed within or southeast of the site parcel in the area of the 'shallow linear swale'.

Regulatory Considerations

The mapped fault trend identified in Morton and others (1980) as 'shallow linear swale' is not included in State or County fault hazard zone maps. Therefore, investigation of the feature as recommended by Moore Twining is at the discretion of the authorizing agency (County of San Bernardino). Representatives of the County examined the fault trench excavations prior to backfill.

Trench Exploration

Two exploratory fault trenches were extended across the trend of the mapped 'shallow linear swale' feature as projected within the southeastern portion of the site. The trenches were approximately 300 feet (T-1) and 100 feet (T-2) long and 10 feet to 5 feet deep and were configured as benched excavations where necessary for safety and access considerations. The trench locations were staked in the field by Terracon prior to excavation. The trench locations are shown on Trench Location Map.

The trenches were excavated with a track-mounted excavator using a 42-inch-wide bucket. The trenches were cleaned and examined for indications of shear/fault features and logged. Horizontal stationing was established with a tape and relative vertical control was provided with a manometer-type level.

Logs of the trenches are included in Exploration Results. The Barstow Formation, as exposed in the site trenches, includes massive to locally well-bedded arkosic fine-grained sandstone with minor siltstone beds and well-bedded siltstone with coarse-grained sandstone intervals. All of the clastic materials are derived from volcanic sources with siltstone and localized claystone beds appearing of lacustrine origin. Bedding is

consistently southwest dipping at moderate to steep angles. A fold in bedding was observed at Station 297 in T-1 and Station 095 in T-2. The fold axis trend is approximately 282 degrees.

The strata in the trench exposures included surface soil profiles developed in alluvium and on underlying bedrock. Rock strata included sandstone and siltstone locally overlain/cut by paleochannel deposits. Surface soils along the southern portion of Trench T-1 included a veneer of eolian deposits overlying and older soil horizon that extends throughout the trenched area.

The observed pedogenic materials are considered to be pre-Holocene in age based on:

- Presence of argillic coatings and associated color hues
- Degree of cementation
- secondary carbonate content
- Development of blocky pedogenic structure
- Character of lag gravel/cobble clasts on the ground surface

The paleochannel deposits exhibit soil development and carbonate features/content consistent with a pre-Holocene age. This was verified by project personnel trained in soils age estimation for archaeological assessment.

We estimate a minimum age range from approximately 100K years bp to 15K years bp for the argillic soils mantling the trenched area.

The exposures were observed by a Certified Engineering Geologist from Terracon and County of San Bernardino. It was agreed by both parties that the argillic soils exhibit pre-Holocene age characteristics and that no evidence of active faulting was observed in the trenches.

The trenches were backfilled without moisture condition or compactive effort. The trench backfill is not considered suitable for structural support of buildings or flatwork. All trench backfill should be removed and replaced with engineered compacted backfill prior to any construction on or near it.

Discussion and Conclusions

The subject mapped fault-related feature, originally identified as ‘shallow linear swale’ by Morton and others (1980), is defined on a photoreconnaissance map that was not field checked. Examination of aerial photographs and field observations did not reveal a feature(s) consistent with faulting at the location of the subject feature. The feature was not included in the figures in FER 177 that identify faults recommended for zoning under the AP Act. The State and County do not recognize the feature on maps delineating potentially hazardous faults.

Evidence for the presence of active/hazardous faulting was not observed in the trenches placed across the project trend of the mapped feature.

The subject feature is listed as #375, 'Lenwood Fault Creep', in the pamphlet to accompany California Geologic Survey Fault Activity Map of California (2010). It also appears on the web-based application https://maps.conservation.ca.gov/cgs/fam/.

Based on the trench exposures placed within the site, active faulting associated with the projection of the subject feature is not present within the site. Geomorphic or erosional features on trend with the subject feature may have been observed by Morton and others (1980) in their photoreconnaissance work; however, we were not able to duplicate such a feature in aerial imagery we examined.

With regard to faulting or seismic hazards for the project site, the potential for strong ground shaking is the higher hazard and can be addressed by design and construction consistent with applicable building codes. This report addresses the potential for surface fault rupture and does not include other geologic or geohazards considerations such as landsliding, seismic shaking, engineering properties of soils/rock. The geohazards report by Moore Twining (2024) provides a discussion of these topics.

The trench was backfilled without compaction with the excavated materials and moisture for dust control. The trench backfill is not considered suitable for structural support of buildings or flatwork. All trench backfill should be removed and replaced with engineered compacted backfill prior to any construction on or near it.

General Comments

Our analysis and opinions are based upon our understanding of the project, the geotechnical conditions in the area, and the data obtained from our site exploration. Variations will occur between exploration point locations or due to the modifying effects of construction or weather. The nature and extent of such variations may not become evident until during or after construction. Terracon should be retained as the Geotechnical Engineer, where noted in this report, to provide observation and testing services during pertinent construction phases. If variations appear, we can provide further evaluation and supplemental recommendations. If variations are noted in the absence of our observation and testing services on-site, we should be immediately notified so that we can provide evaluation and supplemental recommendations.

Our Scope of Services does not include either specifically or by implication any environmental or biological (e.g., mold, fungi, bacteria) assessment of the site or identification or prevention of pollutants, hazardous materials or conditions. If the owner

is concerned about the potential for such contamination or pollution, other studies should be undertaken.

Our services and any correspondence are intended for the sole benefit and exclusive use of our client for specific application to the project discussed and are accomplished in accordance with generally accepted geotechnical engineering practices with no third-party beneficiaries intended. Any third-party access to services or correspondence is solely for information purposes to support the services provided by Terracon to our client. Reliance upon the services and any work product is limited to our client and is not intended for third parties. Any use or reliance of the provided information by third parties is done solely at their own risk. No warranties, either express or implied, are intended or made.

Site characteristics as provided are for design purposes and not to estimate excavation cost. Any use of our report in that regard is done at the sole risk of the excavating cost estimator as there may be variations on the site that are not apparent in the data that could significantly affect excavation cost. Any parties charged with estimating excavation costs should seek their own site characterization for specific purposes to obtain the specific level of detail necessary for costing. Site safety and cost estimating including excavation support and dewatering requirements/design are the responsibility of others. Construction and site development have the potential to affect adjacent properties. Such impacts can include damages due to vibration, modification of groundwater/surface water flow during construction, foundation movement due to undermining or subsidence from excavation, as well as noise or air quality concerns. Evaluation of these items on nearby properties are commonly associated with contractor means and methods and are not addressed in this report. The owner and contractor should consider a preconstruction/precondition survey of surrounding development. If changes in the nature, design, or location of the project are planned, our conclusions and recommendations shall not be considered valid unless we review the changes and either verify or modify our conclusions in writing.

Paleontological Resources Inventory Memorandum

DUDEK
MAIN OFFICE
605 THIRD STREET
ENCINITAS, CALIFORNIA 92024

MEMORANDUM

To:	Phil Angelides, EVC Partners LLC
From:	Michael Williams, Ph.D.
Subject:	Paleontological Resources Inventory Memorandum for the Electric Vehicle Charging Station and Logistics Facility
Date:	September 20, 2024
cc:	Christine Kronenberg, Sarah Siren, Jason Collins - Dudek
Attachment(s):	Figure 1, Project Location Map Figure 2, Geological Map Appendix A, Survey Photos Appendix B, Confidential LACM Paleontological Records Search Results

Dudek conducted a paleontological resources inventory memorandum for the Electric Vehicle Charging Station and Logistics Facility (Project), located in San Bernardino County, California (Figure 1 – Project Location). This memorandum provides the paleontological resources inventory for the 100-acre project site immediately east of Lenwood Boulevard, south of the Mojave River, west of Interstate (I)-15, north of High Desert Estates, a single-family housing development, in Lenwood, California. The Project site is located in Section 8, of Township 9N; Range 2W of the Barstow, California U.S. Geological Service (USGS) 7.5-minute series topographic quadrangle map.

To determine the paleontological sensitivity of the Project site, Dudek performed a paleontological resources inventory for the Project to comply with the California Environmental Quality Act (CEQA) and Society of Vertebrate Paleontology (SVP) guidelines for successful paleontological mitigation (SVP 2010). The inventory consisted of a Natural History Museum of Los Angeles County (LACM) paleontological records search, review of the preliminary geotechnical report prepared for the Project by Moore Twining Associates, Inc. (2022), a paleontological survey of the Project site, and review of geological mapping and geological and paleontological literature. The results of the paleontological records search and paleontological survey were negative for paleontological resources within the Project site; however, the LACM reported over two hundred fossil localities in the region from the same mapped geological units that underlie the Project site.

As portions of the Project site have never been developed, there is a potential to encounter intact subsurface paleontological resources in those areas. As such, a paleontological monitoring program, which includes the preparation and implementation of a Paleontological Resources Impact Mitigation Plan (PRIMP), is necessary to reduce impacts to any potential paleontological resources onsite in those areas underlain by sediments with a high potential to yield significant paleontological resources. This memorandum was prepared by Michael Williams, Ph.D. and Sarah Siren, M.Sc., qualified Principal Investigators for Paleontology, with assistance from Jason Collins, B.A., in accordance with federal and state CEQA guidelines and SVP (2010) standards.

1 Project Location and Description

The approximately 100-acre Project site includes four parcels (APNs 0497-142-03, 0497-142-04, 0497-142-14, and 0497-142-15) and is located on Lenwood Road between California Highway 58 (SR 58) and Interstate 15 (I-15), approximately four miles west of downtown Barstow. Highway 40 is located approximately 2.5 miles to the southeast. The Project site is undeveloped and surrounded by undeveloped lands with the exception of a single-family residential neighborhood, High Desert Estates, located adjacent to the southern Project boundary. The Project site is designated Rural Living (R-L) in the Countywide Plan and zoned R-L. The Project is proposing development on 20-acres in the southern portion of the site with an electric vehicle charging hub for medium and heavy-duty trucks and light duty/passenger vehicles, battery storage, and a 15,000 square foot (sf) commercial building to provide food and other amenities (e.g., showers and rest areas) as trucks and cars are charging. Access would be provided from Lenwood Road. The remaining approximately 80-acres is proposed for up to 1,341,432 sf of light industrial warehouse, logistic, and distribution facilities.

The Project would include connections to existing utilities including water, storm drain, and sewer lines in addition to surface parking, landscaping and biofiltration basins.

2 Paleontological Resources

Paleontological resources are the remains or traces of plants and animals that are preserved in the earth's crust, and per the Society of Vertebrate Paleontology (SVP 2010) guidelines, are older than written history or older than approximately 5,000 years, which approximates the middle Holocene (4,200 to 8,200 years ago; Cohen et al. 2023). They are limited, nonrenewable resources of scientific and educational value and are afforded protection under state laws and regulations. This report satisfies requirements in accordance with state guidelines (13 PRC, 21000 et seq.) and Public Resources Code Section 5097.5 (Stats 1965, c 1136, p. 2792). This analysis also complies with guidelines and significance criteria specified by SVP (2010). Table 1 provides definitions for high, undetermined, low, and no paleontological resource potential, or sensitivity, as set forth in and by the SVP (2010) Guidelines for Determining Significance: Paleontological Resources.

Table 1. Paleontological Resource Sensitivity Criteria

Resource Sensitivity / Potential	Definition
High	Rock units from which vertebrate or significant invertebrate, plant, or trace fossils have been recovered are considered to have a high potential for containing additional significant paleontological resources. Rock units classified as having high potential for producing paleontological resources include, but are not limited to, sedimentary formations and some volcaniclastic formations (e.g., ashes or tephras), and some low-grade metamorphic rocks that contain significant paleontological resources anywhere within their geographical extent, and sedimentary rock units temporally or lithologically suitable for the preservation of fossils (e.g., middle Holocene and older, fine-grained fluvial sandstones, argillaceous and carbonate-rich paleosols, cross-bedded point bar sandstones, fine-grained marine sandstones). Paleontological potential consists of both (1) the potential for yielding abundant or significant vertebrate fossils or for yielding a few significant fossils, large or small, vertebrate, invertebrate, plant, or trace fossils and (2) the importance of recovered evidence for new and significant taxonomic, phylogenetic, paleoecologic, taphonomic, biochronologic, or stratigraphic data. Rock units that contain potentially datable organic remains older than late Holocene, including deposits associated with animal nests or middens, and rock units that may contain new vertebrate deposits, traces, or trackways are also classified as having high potential.
Low Potential	Reports in the paleontological literature or field surveys by a qualified professional paleontologist may allow determination that some rock units have low potential for yielding significant fossils. Such rock units will be poorly represented by fossil specimens in institutional collections or, based on general scientific consensus, only preserve fossils in rare circumstances and the presence of fossils is the exception not the rule; e.g., basalt flows or Recent colluvium. Rock units with low potential typically will not require impact mitigation measures to protect fossils.
Undetermined Potential	Rock units for which little information is available concerning their paleontological content, geologic age, and depositional environment are considered to have undetermined potential. Further study is necessary to determine whether these rock units have high or low potential to contain significant paleontological resources. A field survey by a qualified professional paleontologist to specifically determine the paleontological resource potential of these rock units is required before a paleontological resource impact mitigation program can be developed. In cases where no subsurface data are available, paleontological potential can sometimes be determined by strategically located excavations into subsurface stratigraphy.
No Potential	Some rock units have no potential to contain significant paleontological resources; for instance, high-grade metamorphic rocks (such as gneisses and schists) and plutonic igneous rocks (such as granites and diorites). Rock units with no paleontological resource potential require neither protection nor impact mitigation measures relative to paleontological resources.

Source: SVP 2010.

3.1 California Environmental Quality Act

Paleontological resources are afforded protection under CEQA, which require lead agencies to disclose the potential environmental impacts of their discretionary actions. One of the screening questions in Appendix G of the CEQA Guidelines asks: "Would the project directly or indirectly destroy a unique paleontological resource or site or a unique geologic feature?"

3.2 California Public Resources Code (PRC) Section 5097.5

California's Public Resources Code (PRC) Section 5097.5 states that:

> No person shall knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, rock art, or any other archaeological, paleontological or historical feature, situated on [lands owned by, or under the jurisdiction of, the state, or any city, county, district, authority, or public corporation, or any agency thereof], except with the express permission of the public agency having the jurisdiction over the lands. Violation of this section is a misdemeanor.

3.3 County of San Bernardino

San Bernardino County completed a Final Program Environmental Impact Report (PEIR) in August 2020, for the Countywide Plan (State Clearinghouse No. 2017101033). The PEIR evaluates paleontological resources in Chapter 5.5 and included the following regulatory requirements (RR), goals, and policies:

- RR CUL-1. Cultural and paleontological resources are recognized as nonrenewable resources and receive Protection under the PRC and CEQA.
- RR CUL-3. The removal, without permission, of any paleontological site or feature is prohibited from lands under the jurisdiction of the state or any city, county, district, authority, or public corporation, or any agency thereof (PRC 5097.5). This applies to agencies' own activities, including construction and maintenance, and permit actions by others.
- RR CUL-4. Adverse impacts to paleontological resources from developments on public (state, county, city, and district) lands require reasonable mitigation. (PRC 5097.5)
- Goal CR-2 Historic and Paleontological Resources. Historic resources (buildings, structures, or archaeological resources), and paleontological resources that are protected and preserved for their cultural importance to local communities as well as their research and educational potential.
    - Policy CR-2.3 Paleontological and archaeological resources. We strive to protect paleontological and archaeological resources from loss or destruction by requiring that new development include appropriate mitigation to preserve the quality and integrity of these resources. We require new development to avoid paleontological and archeological

resources whenever possible. If avoidance is not possible, we require the salvage and preservation of paleontological and archeological resources.

- Policy CR-2.5 Public awareness and education. We increase public awareness and conduct education efforts about the unique historic, natural, tribal, and cultural resources in San Bernardino County through the County Museum and in collaboration with other entities and organizations.

In addition, a Mitigation Monitoring and Reporting Program (MMRP) was developed in conjunction with the PEIR to "provide a vehicle" by which monitor mitigation measures and conditions of approval outlined in the PEIR. Protection of paleontological resources are detailed in Mitigation Measures 5.5 and 5.6 of the MMRP.

4 Methods

4.1 Geological Map and Literature Review

Published geological maps (Dibblee and Minch 2008) and published and unpublished reports were reviewed to identify geological units on the Project site and determine their paleontological sensitivity.

4.2 Paleontological Records Search

A records search request was sent to the LACM on May 16, 2023. The purpose of the museum records search is to determine whether there are any known fossil localities in or near the Project site, assist in identifying the sensitivity of geological units present within the Project site, and aide in determining whether a paleontological mitigation program is warranted to avoid or minimize potential adverse effects of construction on paleontological resources.

4.3 Paleontological Survey

Dudek archaeologists Loukas Barton, David Faith, Patrick Hadel, and cross trained archaeological and paleontological surveyor, Jessica Colston, conducted pedestrian surveys of the Project site on April 14, 2023, and July 6, 2023. The survey was conducted to determine if any surficial paleontological resources are present within the Project site and confirm geological mapping. The survey utilized standard paleontological survey procedures and consisted of systematic surface inspection of exposed geological units with high paleontological sensitivity. The ground surface was examined for the presence of exposed surficial fossils. Ground disturbances such as cut banks, burrows, and eroded hillsides were also visually inspected for exposed fossils and sediments.

5 Results

5.1 Geological Map Review and Literature Review

The Project site is located within the Mojave Desert Geomorphic Province (Morton and Miller 2006; CGS 2002). This geomorphic province is characterized as a broad interior region of isolated mountain ranges separated by expanses of desert playas. There are two important fault trends that control topography within this geomorphic province: a prominent northwest to southeast trend and a secondary east-west trend (apparent alignment with Transverse Ranges is significant). The Mojave Desert Geomorphic Province is a wedge-shaped, sharp angled chunk of arid land bounded by the Garlock Fault to the north (southern boundary Sierra Nevada) and the San Andreas Fault to the west, where it bends east from its northwest trend. The northern boundary of the province is separated from the prominent Basin and Range Geomorphic Province by the eastern extension of the Garlock Fault (Dibblee 1967). More specifically, the Project site is located within the western Mojave Desert region also known as the Mojave Block. The Mojave Block is a tectonic block bounded on the southwest by the San Andreas Fault and on the northwest by the Garlock fault zone, along which the bordering mountains were elevated. Both zones are vertical crustal breaks.

According to published geological mapping by Dibblee and Minch (2008) at a 1:62,500 scale, the Project site is mapped as Holocene (present to 11,700 years ago; Cohen et al. [2023]) alluvium (Map Unit Qa), Tertiary sandstone and shale deposits (Map Unit Ts) deposits, and Tertiary sedimentary limestone (Map Unit Tsl) (Figure 2 – Geologic Map). The Quaternary alluvium consists of valley deposited, coarse- to fine-grained, light gray sands that are coarser grained near hills (Dibblee and Minch 2008). The Tertiary sedimentary rocks (Barstow Formation) consist of moderately consolidated sedimentary rocks of fluvial and lacustrine origin that includes the middle Miocene (approximately 7 million years ago [mya] to 16 mya; Cohen et al. [2023]) Barstow Formation (Dibblee and Minch 2008).

The middle Miocene Barstow Formation is an abundantly fossiliferous formation named by Wood et al. (1941) and is the formation for which the Barstovian North American Land Mammal Age (NALMA) is named. The Barstovian NALMA is based on the first occurrence of the fossil bear, *Plithocyon*, and the proboscidean (the taxonomic order that includes elephants), *Zygolophodon* and ranges from approximately 12.5 mya to 15.9 mya (Tedford et al. 2004). Examples of fossils from the Barstow Formation include plants (Reynolds 2013); trace fossils (Howe and Eby 2006); exceptional, three-dimensionally preserved insects (aquatic insect larvae and fairy shrimp) (Park and Downing 2001); tortoises (Brattstrom 1961); boid snakes (Brattstrom 1958); birds (Miller 1952); and large and small mammals (Pagnac and Reynolds 2006; Lindsey 1972). The Barstow Formation has high paleontological sensitivity or potential.

The Quaternary alluvium mapped within the Project site boundaries has low paleontological sensitivity on the surface that increases with depth. Due to deflation of sediments over time and the shifting sands common in the Mojave Desert, recent alluvial and eolian deposits are sometimes underlain by Pleistocene paleosols (fossil soil horizons) at shallow depths bgs (Stewart et al. 2012; Stewart and Hakel 2016). In his compilation of Quaternary (Pleistocene and Holocene) vertebrates from California, Jefferson (1991) lists numerous Pleistocene vertebrate localities from the Mojave Desert in San Bernardino County. Some of the taxa from these fossil localities include fossil fish (*Gila bicolor*), amphibians, reptiles, birds, and small and large mammals (*Equus, Camelops, Canis, Lepus*

sp., Mammuthus sp.). The Quaternary alluvium has low paleontological sensitivity or potential on the surface, increasing to high at potentially shallow depths.

5.2 Paleontological Records Search

The records search results letter from the LACM was received on May 28, 2023. No records of fossil localities were found within the boundaries of the Project site; however, more than 200 fossil localities are located in the region within the same sedimentary deposits as the Project site (Confidential Appendix A). Summarized below in Table 2.

Table 2. LACM Fossil Localities Near the Project Site

Locality Number	Location	Formation	Taxa	Depth
LACM IP 4736	Harper Dry Lake	Unknown formation (Pleistocene)	*Peaclam (Pisidium compressum)*	Unknown
LACM VP 1224, 3352, 3353, 3498, 3512, CIT 209	Victorville, California	Shoemaker Gravel Formation	Mammoth (*Mammuthus*), Horse (*Equus*), Camel family (Camelidae), deer (Cervidae); antelope (Antilocapridae)	Unknown
LACM IP 6125	East end of Rabbit Lake; San Bernardino County	Unknown formation (Pleistocene)	Invertebrates (unspecified)	Unknown
LACM VP 1123	Schuiling Cave, San Bernardino County	Unknown formation (Pleistocene)	Horse (*Equus*), antelope (*Breameryx*), fox (*Urocyon*), camel (*Camelops*), lama (*Tanupolama*), badger (*Taxidae*), wolf (*Canis*), human (*Homo sapiens*), sheep (*Ovis*), hare (*Lepus*), rabbit (*Sylvilagus*), kangaroo rat (*Dipodomys*), pocket mouse (*Perognathus*), pack rat (*Neotoma*); gopher tortoise (*Gopherus*), chuckwalla (*Sauromalus*), rattlesnake (*Crotalus*); vulture (*Gymnogyps*), horned owl (*Bubo*), Scops owl (*Otus*), duck (*Anas, Oxyura, Aythya*), coot (*Fulca*), merganser (*Mergus*), woodpecker (*Colaptes*),	Surface and shallow subsurface

Locality Number	Location	Formation	Taxa	Depth
			hawk (*Buteo*), cat (*Felis, Lynx*), crow (*Corvus*), dove (*Zenaida),* eagle *(Aquila*).	
Over 30 sites	Manix Lake, Manix, California	Manix Lake Beds	Abundant vertebrate fossils, including camel family (*Camelops, Hemiauchenia*), goat (*Capra*), bear (*Ursus*), horse family (*Equus, Neohipparion*), mammoth (*Mammuthus*), ground sloth (*Nothrotheriops*), fish (*Gila*), flamingo (*Phoenicopterus*), grebe (*Aechmophorus*), pelican (*Pelecanus*), goose (*Branta*), stork (*Ciconia*), crane (*Grus*), cormorant (*Phalacrocorax*), eagle (*Aquila*), diving duck (*Aythya).*	Surface and shallow subsurface
29 Vertebrate Localities and 8 invertebrate localities	Mud Hills, north of Barstow	Barstow Formation	(*Brachycrus*), horse (*Merychippus*), sheep (*Pecora*), canine (*Borophagus, Tomarctus,* Canidae), bird (Aves), antelope family (*Merycodus*), carnivore (Carnivora), bear dog (Amphycyoninae), turtle family (Testudinata), camel (Camelidae), cat (Felidae, *Peudoaelurus*), rabbit (Leporidae), artiodactyl (Artiodactyla, Palaeomerycinae, Dromomerycinae), peccary (*Dyseohyus, Cynorca*), elephant clade (Proboscidea), weasel family (Mustelidae), and other unidentified mammals; Invertebrates (primarily gastropods and bivalves)	Surface and shallow subsurface

Locality Number	Location	Formation	Taxa	Depth
LACM VP 3181	North of Hinkley	Barstow Formation	Rodent (Rodentia), antelope (Merycodontinae, *Merycodus*), weasel (*Leptarctus*), horse (*Merychippus*), rhinoceros family (Rhinocerotoidea), artiodactyl (Artiodactyla, Dromomerycinae), carnivore (Carnivora), perissodactyl (Perissodactyla), camel (Camelidae), canine (Candidae), cat (Felidae), rabbit (Leporidae); bird (Aves); invertebrates (Mollusca).	Surface

5.3 Paleontological Survey

The approximately 100-acre Project site is mostly flat and is comprised of desert pavement surfaces and sand dune formations. Ground surface visibility was moderate, between 40% - 60% (Photo 1), within the desert pavement surfaces and in areas of denser vegetation, and excellent, between 70% - 100%, within areas of regular vehicle overland travel and among the sand dunes (Photo 2). Vegetation within the Project site consisted of creosote bush and various species of invasive grasses. Within the sand dunes, sediments were loosely compacted. Intact desert pavement surfaces were present throughout the Project site and consisted of highly compacted, light brown silty sand, and sub-angular rhyolite and cryptocrystalline silicate nodules. Barstow Formation sedimentary rock outcroppings were observed and documented in the east and southeast portions of the Project site (Photo 3 and 4). No paleontological resources were observed during the survey.

6 Summary and Management Recommendations

No paleontological resources were identified within the Project site as a result of the institutional records search, paleontological survey, and desktop geological and paleontological review. However, the paleontological records search conducted by the LACM detailed 40 Pleistocene fossil localities and 38 middle Miocene fossil localities nearby from the same geological units present within the Project site, as well as over 200 localities in the region from the middle Miocene Barstow Formation. In addition, Pleistocene deposits and the Barstow Formation from this portion of the Mojave Desert have a record of producing significant paleontological resources. The Holocene alluvium within the Project site has low paleontological resources sensitivity on the surface, increasing to high at potentially shallow depths. The Tertiary sedimentary and Tertiary sedimentary limestone deposits (Barstow Formation) have a high paleontological resources sensitivity (See Figure 2 – Geologic Map). Based on the records search results, paleontological survey, map and literature review, and planned excavations for the Project, the Project site has a high potential to produce paleontological resources during planned construction activities. In the

event intact paleontological resources are located on the Project site, ground-disturbing activities associated with construction of the Project, such as grading during site preparation and trenching for utilities, have the potential to destroy a unique paleontological resource or site. The following is recommended to ensure if any paleontological resources are discovered a protocol is in place to minimize damage to the resource.

Prior to commencement of any grading activity on-site, the applicant shall retain a qualified paleontologist, subject to the review and approval of the County. The paleontologist shall prepare a Paleontological Resources Impact Mitigation Program (PRIMP) for the Project consistent with the Society of Vertebrate Paleontology (2010) guidelines. The PRIMP shall outline requirements for preconstruction meeting attendance and worker environmental awareness training, adequate onsite monitoring, procedures for adequate paleontological monitoring, discoveries treatment, paleontological methods (including sediment sampling for microvertebrate fossils), reporting, and collections management. The PRIMP shall also include protocols for spot-checking significant ground-disturbing activities below a depth of five feet below the ground surface or five feet below the depth of artificial fill in areas mapped as Holocene alluvium and full-time paleontological monitoring below the depth of artificial fill in areas underlain by Tertiary sandstone and shale deposits and Tertiary limestone deposits (Barstow Formation). In the event that paleontological resources (e.g., fossils) are unearthed during grading, the paleontological monitor shall temporarily halt and/or divert grading activity to allow recovery of paleontological resources. The area of discovery shall be roped off with a 50-foot radius buffer. While the paleontological monitor recovers the find, work may continue in areas outside of the buffer as long as another paleontological monitor is available and present for the work. Once documentation and collection of the find is completed, the monitor shall remove the rope and allow grading to recommence in the area of the find. Costs for laboratory work and curation fees for any significant fossils recovered during the monitoring program are the responsibility of the project proponent or applicant. Recovered resources should be curated at a repository within San Bernardino or Riverside County.

Should you have any questions relating to this report and its findings please contact Michael Williams (mwilliams@dudek.com) or Sarah Siren (ssiren@dudek.com).

Respectfully Submitted,

Michael Williams, Ph.D.

PHASE I ENVIRONMENTAL SITE ASSESSMENT

PROPOSED LAND DEVELOPMENT
SOUTHEAST OF LENWOOD ROAD AND AGATE ROAD
BARSTOW, CA 92311

EXECUTIVE SUMMARY

Moore Twining Associates, Inc. (Moore Twining) was retained by EVC Partners, LLC to conduct a Phase I Environmental Site Assessment (Phase I ESA) for a property located southeast of Lenwood Road and Agate Road, in Barstow, California (Subject Property). This Phase I ESA was conducted in conformance with the methods and procedures described in the American Society for Testing and Materials (ASTM) "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process" (E1527-21), published November 2021.

This summary should be used in conjunction with the entire report. It should be recognized that details were not included or fully developed in this section, and the report must be read in its entirety for a comprehensive understanding of the Subject Property history and conditions. Please review the entire report for more information regarding Moore Twining's findings and opinions.

Subject Property Summary

The Subject Property is located southeast of Lenwood Road and Agate Road, in Barstow, California. The Subject Property comprises approximately 96.06 acres of vacant, undeveloped land. The Subject Property is associated with the San Bernardino County assessor's parcel numbers 049-714-203, 049-714-204, 049-714-214, and 049-714-215.

At the time of Subject Property reconnaissance, the Subject Property was undeveloped land, but a transient camp was observed toward the south-central portion of the Subject Property. According to EVC Partners, LLC, the camp was removed by authorities following the subject property reconnaissance.

Based on Moore Twining's review of historical documents, the Subject Property was vacant undeveloped land since at least the early 1950's.

The Subject Property is not listed within a 1% or a 0.2% Annual Chance Flood Hazard zone.

The Subject Property was not listed on any regulatory databases.

Off-Site Property Summary

Based on Moore Twining's review of historical documents, the properties surrounding the Subject Property have been primarily vacant/undeveloped land. During the 1960's, a small residential community was developed to the east-northeast of the Subject Property. In the mid-1980's, a residential development was developed to the south of the Subject Property. A commercial structure was present by 2005 to the southwest, across Lenwood Road.

At the time of the Subject Property reconnaissance, a residential development was present to the south. Undeveloped land was present to the east. Lenwood Road adjoined the Subject Property to the west, followed by undeveloped land. To the north was undeveloped land and single-family homes.

Conclusions Summary

On behalf of EVC Partners, LLC, Moore Twining performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM E1527-21 for a property located southeast of Lenwood Road and Agate Road, in Barstow, California. This assessment has revealed no evidence of CRECs, HRECs, or RECs.

1.0 INTRODUCTION

Moore Twining Associates, Inc. (Moore Twining) was retained by EVC Partners, LLC to conduct a Phase I Environmental Site Assessment (Phase I ESA) for a property located southeast of Lenwood Road and Agate Road in Barstow, California (Subject Property). This Phase I ESA was conducted in conformance with the methods and procedures described in the American Society for Testing and Materials (ASTM) "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process" (E1527-21), published November 2021.

1.1 Objective

The objective of this assessment was to identify Recognized Environmental Conditions (RECs) located at the Subject Property or adjacent properties that could present material risk of harm to public health or to the environment. Recognized environmental conditions are defined in ASTM E1527-21 as the presence or likely presence of any hazardous wastes and/or substances or petroleum products in, on or at a property under conditions that indicate an existing release, a past release, or a material threat of a release to the environment.

1.2 Scope of Services

This Phase I ESA was performed to evaluate the potential presence of environmental conditions that may have resulted from operations at the Subject Property or at nearby properties. The assessment included a Subject Property reconnaissance, a review of available documentation of land-use history for evidence of the use, storage and/or disposal of hazardous substances, and a review of available regulatory information. This Phase I ESA included the following tasks:

- A review of the current and past uses of the Subject Property since 1932;
- A Subject Property reconnaissance to assess evidence of current and/or past use or storage of toxic or hazardous material; on-Subject Property ponds, landfills, drywells, waste streams or other disposal units; visible soil discoloration; aboveground or underground storage tanks; electrical transformers containing polychlorinated biphenyls (PCBs); and drums, barrels, and other storage containers;
- Visual observation of adjacent properties in order to determine if current and/or historical operations associated with these properties may pose a threat to the Subject Property;
- A review of available federal Environmental Protection Agency (EPA), state EPA and regulatory agency lists of known or potential hazardous waste sites or landfills, and sites currently under investigation for environmental violations in the Subject Property area. Using area-profile services provided by Environmental Data Resources, Inc. (EDR), Moore Twining cataloged properties near the Subject Property that have been identified on regulatory agency lists. Search criteria were in conformance with ASTM E1527-21;

- Contact with relevant municipal, county and state agencies to review readily available records and permits; and

- Preparation of this report to present our methods, findings and conclusions.

The Scope of Services specifically excluded cultural, archeological, and biological assessments, as well as sampling and analysis for the potential presence of asbestos containing building materials, lead based paint, or an assessment for radon gas. In addition, the Scope of Services did not include the collection and/or analysis of any materials including air, soil, soil-gas, or groundwater samples.

1.3 Limitations and Limited Conditions

The purpose of an environmental assessment is to reasonably assess the potential for, or actual impact of, past practices on a given Subject Property that may pose an environmental impairment to the Subject Property. No assessment is thorough enough to identify all potential environmental impairments at a given Subject Property. If environmental impairments have not been identified during the assessment, such a finding should not, therefore, be construed as a guarantee of the absence of such conditions on the Subject Property, but rather the result of the services performed within the scope, limitations, and cost of the work performed.

The conclusions presented in this report are solely professional opinions based on information provided regarding the Subject Property and the findings of the reconnaissance and records search. Information obtained from the aerial photography is an interpretation of features observed in the photographs. Actual conditions at the Subject Property may have been different from those interpreted. Conclusions presented are based on conditions as they existed at the time the work was performed. Changes in existing conditions of the Subject Property due to time lapse, natural causes, or operations adjacent to the Subject Property may deem conclusions presented in this Phase I ESA report invalid, unless the changes are reviewed, and the conclusions reevaluated. Such conditions may require additional Subject Property reconnaissance and require field exploration and laboratory testing to assess if the conclusions are applicable considering the changed conditions.

This work was performed for the sole use of our client. Any reliance on this report by a third party is at such party's sole risk. Others who seek to rely on the findings have a duty to determine the adequacy of this report for their intended use, time, and location. Moore Twining does not warrant the accuracy of information supplied by others, nor the use of segregated portions of this report. No other warranty, either expressed or implied, is made. The standard of practice is time dependent. Services provided were performed consistent with generally accepted professional consulting principles and practices for environmental assessors at the time this work was performed. The findings and conclusions presented in this report are solely professional opinions derived in accordance with current standards of professional practice.

2.0 SUBJECT PROPERTY DESCRIPTION

Information concerning the Subject Property was obtained from a Subject Property reconnaissance and a review of the documents referenced in Sections 4.0 and 5.0 of this report. This information is summarized in the following sections.

2.1 Location and Description of Property

The Subject Property is located southeast of Lenwood Road and Agate Road, in Barstow, California. The Subject Property comprises approximately 96.06 acres of vacant, undeveloped land. The Subject Property is associated with the San Bernardino County assessor's parcel numbers 049-714-203, 049-714-204, 049-714-214, and 049-714-215.

The listed owner for the Subject Property is:
Kevin Lee Quaid

A Subject Property location map is presented as Drawing 1, and a Subject Property plan, which includes Subject Property boundaries, is presented as Drawing 2 in Appendix A.

2.2 Physical and Environmental Setting of the Subject Property

Environmental characteristics including topography, geology, soil, and hydrogeology were evaluated based on Subject Property observations, and review of published literature and maps. The findings are summarized in the following table.

PHYSICAL SETTING INFORMATION FOR THE SUBJECT PROPERTY AND SURROUNDING AREA		SOURCE
Location	Barstow, California	EDR Report, April 11, 2022
Subject Property Elevation	The Subject Property elevation is approximately 2,215 feet above mean sea level.	
Topographic Gradient	Generally sloping toward the north.	
Closest Surface Water	The Mojave River, an intermittent river located approximately 0.4 miles north of the subject Property.	
Flood Plains[1]	According to FEMA DFIRM Flood Data provided by EDR, the Subject Property is not located within a 1% or a 0.2% Annual Chance Flood Hazard zone.	FEMA DFIRM Flood Data Map 06071C3915H

[1] This is for general locational information only. The data presented should not be used for development purposes, as a comprehensive flood zone study has not been conducted.

PHYSICAL SETTING INFORMATION FOR THE SUBJECT PROPERTY AND SURROUNDING AREA		SOURCE
Wetlands	No wetlands were reported on the Property[2].	National Wetlands Inventory https://www.fws.gov/wetlands/data/mapper.html
General Soil Characteristics		
Soil Type	Victorville	United States Department of Agriculture, Soil Survey website; http://websoilsurvey.sc.egov.usda.gov
Description	Soils are deep to moderately deep, moderately well to well drained, with moderately coarse textures.	
Area Specific Geology/Hydrogeology Characteristics		
Geology	The Subject Property is located within the Mojave Geomorphic Province, a region of isolated mountain ranges and broad expanses of desert and playas with an enclosed drainage pattern. The Mojave Geomorphic Province creates a sharp angled wedge between the Garlock Fault, the southern boundary of the Sierra Nevada Mountain Range, and the San Andreas Fault, where it bends to the east from its typical northwest trend. The general topography of the region is controlled by these two main fault systems which puts the Mojave in apparent alignment with the Transverse Ranges Geomorphic Province to the west. The subsurface of the Site is characterized by thick sequences of Pleistocene age alluvium, terrace, and playa deposits.	(Wagner, 2002) (California Geologic Survey, 2010)
Hydrogeology	According to information obtained from the GeoTracker website Property, depth to first encountered groundwater is estimated to be approximately 100 feet below ground surface.	GeoTracker
Oil and Gas Wells		
Current Oil and Gas Wells on Subject Property	No oil and/or gas wells were reported to be on the Subject Property or on adjoining properties within 1,000 feet.	California Department of Conservation, Geologic Energy Management Division (CalGEM) websitehttps://www.conservation.ca.gov/calgem/Pages/WellFinder.aspx

[2] This is for general locational information only. The data presented should not be used for development purposes, as a comprehensive wetland study has not been conducted.

PHYSICAL SETTING INFORMATION FOR THE SUBJECT PROPERTY AND SURROUNDING AREA		SOURCE
Historical Oil and Gas Wells on Subject Property	No historical oil and/or gas wells were reported to be located on the Subject Property or on adjoining properties within 1,000 feet.	California Department of Conservation, CalGEM website http://www.conservation.ca.gov/dog/Pages/WellFinder.aspx

3.0 INFORMATION FROM THE SUBJECT PROPERTY RECONNAISSANCE

The objective of the subject property reconnaissance was to observe the Subject Property for specific indicators of environmental conditions. The reconnaissance included a systematic search by foot of practically accessible areas of the Subject Property and adjacent properties. A Site Plan depicting the Subject Property, adjoining property use, and observed on-Subject Property features is presented in Appendix A of this report. Additionally, photographs were taken during the Subject Property reconnaissance, and selected photographs of the Subject Property are presented in Appendix B of this report.

The Subject Property reconnaissance was conducted on April 15, 2022, by Ms. Sara Bloom, a representative of Moore Twining.

3.1 Subject Property Reconnaissance - Description of Structures, Roads, and Other Subject Property Improvements

At the time of the Subject Property reconnaissance, the Subject Property comprised approximately 96.06 acres of undeveloped land.

3.2 Current Uses of the Subject Property

At the time of Subject Property reconnaissance, the Subject Property was undeveloped land; a transient camp was observed toward the south-central portion of the Subject Property.

3.3 Current Uses of the Adjoining Properties

At the time of the Subject Property reconnaissance:

- A residential development was located to the south;
- Undeveloped land was located to the east;
- Lenwood road was located to the west with undeveloped land beyond;
- Undeveloped land and single-family homes were located to the north.

3.4 Subject Property Reconnaissance - Specific Indicators of Environmental Conditions

In addition to the general description of the Subject Property, specific indicators of environmental conditions were also evaluated for the Subject Property. Observations made during the Subject Property

reconnaissance are summarized in the following table. Affirmative responses are discussed in more detail following the table.

Category	Feature	Observed
Interior (N/A)	Elevators	N/A
	Air Compressors	N/A
	Incinerators	N/A
	Waste Treatment Systems	N/A
	Presses/Stamping Equipment	N/A
	Press Pits	N/A
	Hydraulic Lifts or Hoists	N/A
	Paint Booth	N/A
	Plating Tanks	N/A
	Lathes, Screw Machines, etc.	N/A
	Regulated Hazardous Materials Use and Storage	N/A
	Floor Drains and Similar Facilities	N/A
Aboveground Chemical or Other Waste Storage or Waste Streams	Aboveground Storage Tanks (ASTs)	No
	Drums, Barrels and/or Containers > than 5-gallons	No
	Chip Hoppers	No
	Hazardous or Petroleum Waste Streams	No
Underground Chemical or Waste storage, Drainage or Collection Systems	Underground Storage Tanks (USTs)	No
	Fuel Dispensers	No
	Sumps or Cisterns	No
	Dry Wells	No
	Oil/Water Separators	No
	Flood Drains, Trench Drains, etc.	No
	Pipeline Markers	No
Exterior Observations	Stressed Vegetation	No
	Stained Soil or Pavement	No
	Pad or Pole-Mounted Transformers and/or Capacitors	No
	Soil Piles of Unknown Origin	No
	Exterior Dumpsters with Staining	No
	Hydraulic Box Crushers	No
	Leachate or Other Waste Seeps	No
	Trash, Debris, and/or Other Waste Materials	**Yes**
	Uncontrolled Dumping or Disposal Areas	**Yes**
	Surface Water Discoloration, Sheen or Free Product	No
	Strong, Pungent or Noxious Odors	No
	Storm Water Retention or Detention Ponds	No
	Pits, Ponds or Lagoons	No

Throughout the Subject Property, tires, concrete debris, and household trash were observed. A transient camp was observed to the south-central portion of the Subject Property, but, for safety reasons, was only viewed from a distance that was deemed to be safe.

4.0 HISTORICAL AND CURRENT INFORMATION ON THE PROPERTY AND ADJOINING PROPERTIES

The history of land-use on and near the Subject Property was determined from the review of historic aerial photographs, topographic maps, Sanborn maps, building permits, and historic city directories. The findings are summarized in the following subsections.

4.1 Aerial Photograph Review

Available historical aerial photographs of the Subject Property and vicinity for the years 1953, 1959, 1964, 1968, 1970, 1973, 1984, 2005, 2009, 2012, and 2016 were reviewed for indications of past Subject Property use and/or Subject Property activities which may have involved the manufacture, generation, use, storage, and/or disposal of hazardous materials. The results of the aerial photograph review are summarized in the following table. Copies of the historical aerial photographs are included in Appendix D of this report.

Year	Summary of Information
1953-1959 (EDR)	The Subject Property and surrounding areas are vacant, undeveloped land. Lenwood Road is present to the west.
1964-1973 (EDR)	No change to the Subject Property was observed. A residential development was present to the northeast.
1984 (EDR)	No change to the Subject Property is observed. Additional residential structures are present to the north of the Subject Property. To the south, streets have been developed for a residential development. To the west-southwest, across Lenwood Road, grading has been conducted.
2005-2016 (EDR)	No change to the Subject Property was observed. To the south, the residential community has been further developed. A large rectangular commercial structure is now present to the southwest, across Lenwood Road. No changes to the north or east were observed.

4.2 Topographic Map Review

Available topographic maps of the Subject Property and vicinity for the years 1932, 1934, 1956, 1971, 1984, 1993, 2012, 2015, and 2018 were reviewed for indications of past Subject Property use and/or Subject Property activities which may have involved the manufacture, generation, use, storage, and/or disposal of hazardous materials. Copies of the historical topographic maps are included in Appendix D.

No environmental concerns were observed on the Subject Property or adjacent properties.

4.3 Sanborn Fire Insurance Map Review

Sanborn maps were not available for the Subject Property or surrounding areas.

4.4 Historical City Directory Review

City directories can provide information concerning past and current occupancy of the Subject Property and adjacent areas. Historical city directory information for this assessment was provided by EDR. A copy of the historical city directories is included in Appendix D.

On-Subject Property

The Subject Property was not listed in the EDR City Directory.

Off-Site Property

No adjacent properties were identified in the EDR City Directory report.

4.5 Building Permits

Building records can provide a history of on-site structures, features, and development. A records request was submitted to the City of Barstow and the San Bernardino County; neither agency had any building permits or records. A copy of the records request and response is included in Appendix D of this report.

4.6 Review of Record Land Title Records

Title documents, including a chain of title and/or title report, can provide the environmental professional with information regarding current and past ownership and information regarding environmental liens and/or land use and activity limitations.

No institutional and engineering controls, land use limitations or environmental liens related to remediation and/or cleanup were found as part of this assessment.

4.7 User Provided Information

This section summarizes information provided by the user that assisted in the identification of potential RECs associated with the Subject Property.

4.7.1 Environmental Questionnaires

Moore Twining submitted Environmental Questionnaires to Mr. Brian Vail (User/Client) and Mr. Kevin Lee Quaid (property owner). Mr. Vail had no prior knowledge about the current or past uses of the Subject Property, nor was he aware of any environmental liens or impacts or AULs which may impact the Subject Property. Mr. Quaid had no knowledge of any past activities/uses of the subject Property.

Copies of the completed questionnaires are included in Appendix E of this report.

Following the reconnaissance, Mr. Vail was informed of the transient camp located on the Subject Property. Mr. Vail later informed Moore Twining via email that the land owner had reported the camp and that the camp was subsequently removed by law enforcement.

4.7.2 Previous Investigations

No reports of previous investigations were provided by the client or otherwise located.

4.7.3 Title Documentation

Title documents, including a chain of title and/or title report, can provide the environmental professional with information regarding current and past ownership and information regarding environmental liens and/or land use and activity limitations.

4.7.4 Institutional and Engineering Controls/Land Use Limitations/Environmental Liens

Institutional and Engineering Controls can indicate the current and/or historical presence of recognized environmental conditions that required remedial activity at the Subject Property.

No institutional and engineering controls, land use limitations, or environmental liens related to remediation and/or cleanup were found as part of this assessment.

4.8 Past Uses of the Property

Based on Moore Twining's review of historical documents, the Subject Property was vacant undeveloped land since at least the early 1930's.

4.9 Past Uses of Adjoining Property

Based on Moore Twining's review of historical documents, the properties surrounding the Subject Property have been primarily vacant/undeveloped. During the 1960's, a small residential community was developed to the east-northeast. By the mid-1980's, a residential development began development to the south. A commercial structure was built sometime between 1984 and 2005 to the southwest, across Lenwood Road.

5.0 REGULATORY RECORDS REVIEW

Requests to review files for the Subject Property were submitted to the Regional Water Quality Control Board (RWQCB), the Department of Toxic Substances Control (DTSC), and the San Bernardino County Department of Environmental Health (SBCDEH). Printouts and information from regulatory databases and agencies are included in Appendix C.

5.1 Facilities Identified in the Regulatory Record Review

The information regarding the Subject Property was obtained from the EDR report, the DTSC Envirostor website (http://envirostor.dtsc.ca.gov/, Envirostor), and the State Water Resource Control Board's GeoTracker website (http://geotracker.waterboards.ca.gov/, GeoTracker). At the time this report was issued to the client, the Subject Property did not appear on either website.

5.2 Facilities Identified in the EDR Report

Moore Twining contracted EDR to perform a search of available federal, state, and local database information systems for identifying known recognized environmental conditions present on the Subject Property and nearby properties that have the potential to adversely impact the Subject Property being assessed in this study. EDR's findings are summarized below. The complete report furnished by EDR is included in Appendix D of the report.

NR = Not Requested (Beyond Search Distance)
TP = Target Property
* = Table includes only databases required for ASTM E1527-21 compliance. Other databases are included in the EDR report and discussed in the following sections as appropriate.

5.2.1 On-Subject Property

The Subject Property was not listed on any regulatory databases.

5.2.2 Off-Subject Property

Moore Twining's review of the referenced databases also considered the potential or likelihood of contamination from adjoining and nearby properties impacting this Subject Property. To evaluate which of the adjoining and nearby properties identified in the regulatory database report present an environmental risk to the Subject Property, Moore Twining considered the following criteria:

- The type of database on which the property is identified;
- The topographic position of the property relative to the Subject Property;
- The direction and distance of the property from the Subject Property;
- Local soil conditions in the area of the Subject Property;
- The known or inferred groundwater flow direction;
- The status of the respective regulatory agency-required investigation(s) of the identified property, if any; and
- Surface and subsurface obstructions and diversions (e.g., buildings, roads, sewer systems, utility service lines, rivers, lakes and ditches) located between the property and the Subject Property.

Summary of Identified Properties				
Property	**Distance from Property**	**Databases**	**Risk to Property**	**Rationale**
Valmont Newmark, Newmark Intl Inc. 3970 Lenwood Road	267 feet southwest and up-gradient	RCRA NonGen/NLR HWTS CERS Haz Waste NPDES San Bern Co Permit CIWQS CERS	No	The listed site is a supplier of metal and concrete products used for construction. No manufacturing of products takes place at the facility. Wastes include concrete items that have broken. Multiple violations have been reported, but all have been corrected, and were typically corrected at the time of inspection. Violations were typically associated with labeling of waste storage containers or paperwork. The listed site is not considered a risk to the Subject Property.

No other off-site properties were judged to present a potential environmental risk to the Subject Property and/or warranted additional clarification.

5.2.3 Orphan Properties

An Orphan Property is a listed property in the same zip code as the Subject Property which cannot be mapped because of inadequate address information. One Orphan Property was included in the EDR report, but based on review available data, it is considered a low risk to the Subject Property.

6.0 SUMMARY OF FINDINGS AND OPINIONS

The findings of the Phase I ESA are summarized in the following sections:

6.1 Subject Property

The Subject Property is located southeast of Lenwood Road and Agate Road, in Barstow, California. The Subject Property comprises approximately 96.06 acres of vacant, undeveloped land. The property is associated with the San Bernardino County assessor's parcel numbers 049-714-203, 049-714-204, 049-714-214, and 049-714-215.

At the time of Subject Property reconnaissance, the Subject Property was undeveloped land with a transient camp was observed toward the south-central portion of the property. Following reporting the camp to EVC Partners, LLC, the camp was removed by law enforcement.

Based on Moore Twining's review of historical documents, the Subject Property was vacant undeveloped land since at least the early 1930's.

The Subject Property is not listed within a 1% or a 0.2% Annual Chance Flood Hazard zone.

The Subject Property was not listed on any regulatory databases.

6.2 Off-Subject Property

Based on Moore Twining's review of historical documents, the properties surrounding the Subject Property have been primarily vacant/undeveloped. During the 1960's, a small residential community was developed to the east-northeast. By the mid-1980's, a residential development began development to the south. A commercial structure was built sometime between 1984 and 2005 to the southwest, across Lenwood Road.

At the time of the Subject Property reconnaissance a residential development was to the south, undeveloped land was to the east, Lenwood road was to the west with undeveloped land beyond, and undeveloped land and single-family homes were to the north.

6.3 Data Gaps, Limitations, and Deviations

Data gaps are described as a lack of or inability to obtain information required by the standards and practices listed in ASTM E1527-21, despite good faith efforts by the environmental professional or prospective landowner.

The material content of this report is intended to be consistent with a standard of practice as defined by ASTM E1527-21. However, the report format differs in style, arrangement, and presentation of material facts from the format described by ASTM.

7.0 CONCLUSIONS

On behalf of EVC Partners, LLC, Moore Twining performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM E1527-21 for a property located southeast of Lenwood Road and Agate Road, in Barstow, California. This assessment has revealed no evidence of CRECs, HRECs, or RECs.

8.0 CLOSING

Moore Twining Associates, Inc. performed a Phase I Environmental Subject Property Assessment in conformance with the scope and limitations of ASTM E1527-21 for the Subject Property. Any exceptions to, or deletions from, this practice are described Section 6.3 of this report.

We appreciate the opportunity to be of service to EVC Partners, LLC on this project. Please contact our office at (800) 268-7021 if you have any questions regarding this report.

Sincerely,
MOORE TWINING ASSOCIATES, INC.
Environmental Services Division

Sara Bloom
Phase I Assessment Project Manager

Katie Lister PG, QSD
Senior Geologist

"I declare that, to the best of my knowledge and belief, I meet the definition of Environmental Professional. I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312."

10.0 QUALIFICATIONS OF ENVIRONMENTAL PROFESSIONALS

Moore Twining Associates, Inc. Phase I Environmental Site Assessment staff is composed of a group of environmental professionals that perform Environmental Site Assessments on a routine basis. The Phase I ESA staff is managed and supervised by individuals who conduct, prepare, oversee, and/or review Environmental Site Assessments on a daily basis. Qualification profiles for these individuals are provided in the following section.

Prepared By
Sara Bloom

Ms. Bloom has eighteen years of experience conducting Phase I Environmental Site Assessments, Phase II assessment work, and Phase III remediation. Ms. Bloom has conducted environmental Subject Property assessments for a number of different project types including shopping centers, industrial properties, gas stations/bulk terminals, dry cleaners, and large vacant properties.

Reviewed by
Katie Lister PG, QSD
Senior Geologist

Mrs. Lister has nineteen years of experience conducting Phase I Environmental Site Assessments, Phase II assessment work, and Phase III remediation. Mrs. Lister has conducted environmental site assessments for a number of different project types including pesticide production facilities, shopping centers, gas stations, school sites, mines, large vacant properties, and agricultural sites.

Subject: RE: Public Records Request

Hello Sara,

The Building Department was unable to process the reference request. All parcels are located outside the City of Barstow jurisdiction and request must be completed through the San Bernardino County.

This completes my response to your Public Records Act request. If you have any questions, please do not hesitate to contact me.

Sincerely,

MARIA

Good Morning,

With this land being vacant... I don't have much of the information requested. However, here are the plans associated with the sewer system.

Thanks,

Kody Tompkins

The California Public Records Act (Government Code Section 6250 et seq.) provides California citizens with important rights to obtain access to records held by public agencies in the State. In recent years the City of Barstow has experienced a substantial growth in the volume of requests for public records and the staff time required to respond to such requests, particularly with respect to requests for documents relevant to disputes between private parties. The purpose of this policy is to clarify for the public, attorneys, insurance adjusters and private investigators, the process by which the City will respond to requests for records under the Public Records Act.

1. All requests for public records shall be in writing on a form approved by the City Council, unless the request is to review an agenda or agenda reports of the City or a City Commission or committee, the Municipal Code, the General Plan or the Uniform Building Codes, which are available in the City Clerk's Office.

2. The City Clerk will respond to all requests as soon as possible, but not later than the ten-day period, or extensions thereof, as provided by Government Code Section 6253.

    a. The City Clerk shall review the request and determine whether the request seeks identifiable records and, if not, the City Clerk shall assist the person making the request to identify records and information that are responsive to the request or to the purpose of the request, if stated.

    b. The City Clerk shall request all City Departments which may have the records requested to search their files and report back to the City Clerk on whether the Department has the records and, if so, when the records can be made available to the person seeking them.

    c. The City Clerk shall respond to the person requesting records by advising him or her in writing of the availability of the documents, a description of the information technology and physical location in which the records exist, and whether any of the documents are exempt from disclosure under the provisions of the Public Records Act. To the extent feasible, the City Clerk will provide suggestions for overcoming any practical basis for denying access to the records or information sought in compliance with the Public Records Act.

    d. If a request is made for copies of the records, the City Clerk shall also advise the person requesting copies of the estimated costs of copying the records requested.

    e. The person requesting the copies shall pay the per page charge for copying as set forth by resolution of the City Council for all copies requested. The City Clerk shall not make the requested copies until a deposit in the amount of the estimated costs of copying is received and shall not release the copies until the full cost of copying is paid to the City.

3. In accordance with the Public Records Act, the City will provide only specific identifiable records but will not research City records for particular types of information or analyze information, which may be contained within public records.

4. The City will respond to requests for public records in accordance with the terms of the California Public Records Act as the Act now exists or may hereafter be amended, and nothing in this Policy is intended nor shall it be construed to conflict with the terms of the Public Records Act.

Dear Requestor:

On, April 13, 2022, the Department of Toxic Substances Control (DTSC) received your email of April 13, 2022, requesting records under the Public Records Act. After a thorough review of our files, *no site records* were found pertaining to the sites/facilities referenced above.

A large number of our records are available on EnviroStor, an online database that provides non-confidential, public access to DTSCs data management system. It tracks our cleanup, permitting, enforcement, and investigation efforts at hazardous waste facilities and sites with known or suspected contamination issues. EnviroStor is available 24/7, 365 days a year. The data reflects the latest updates as they are entered in the system. Access it from your computer or smartphone, the local library – anywhere Internet access is available. Just go to www.envirostor.dtsc.ca.gov. You will find a step-by-step tour of EnviroStor under the "How to Use EnviroStor" menu on the website.

If you have any questions or would like further information regarding your request, please contact me via email at: jone.barrio@dtsc.ca.gov.

Sincerely,
Jone Barrio

Subject: RE: PRA220406 - Records Request: River West - Barstow - DUE 4/25/2022

Hello Sara,

My name is John Yu and I am responding on behalf of the Lahontan Water Board for a public records request at the east side of Lenwood Road, between Agate Road and Camino Del Norte in Barstow, CA 92311. There isn't a regulated facility located at the APNs you provided which makes it more likely the Lahontan Water Board does not have much historical documents relating to the area. If you see the image below, there are several inactive and active wells operated by Golden State Water Company northeast (blue dots) and leaking underground storage tank cases (red squares) southeast of the requested site. You can access these on our public database GeoTracker and use the legend to enable filters. I would recommend looking through the well reports and possibly directly contacting the Golden State Water Company for more detailed data and reports. Please let me know if you need any other information. Thank you!

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of state and tribal leaking storage tanks

LUST: Leaking Underground Storage Tank (LUST) Sites included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the LUST list, as provided by EDR, has revealed that there is 1 LUST site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
WHITING BROTHERS	***24645 MAIN***	***SSE 1/4 - 1/2 (0.400 mi.)***	***9***	***34***
Database: LUST REG 6V, Date of Government Version: 06/07/2005				
Status: Remedial action (cleanup) Underway				

ADDITIONAL ENVIRONMENTAL RECORDS

Local Lists of Hazardous waste / Contaminated Sites

CERS HAZ WASTE: List of sites in the California Environmental Protection Agency (CalEPA) Regulated Site Portal which fall under the Hazardous Chemical Management, Hazardous Waste Onsite Treatment, Household Hazardous Waste Collection, Hazardous Waste Generator, and RCRA LQ HW Generator programs.

A review of the CERS HAZ WASTE list, as provided by EDR, and dated 10/18/2021 has revealed that there

is 1 CERS HAZ WASTE site within approximately 0.25 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
NEWMARK INTL INC	***3970 LENWOOD RD***	***SSW 0 - 1/8 (0.051 mi.)***	***A2***	***11***

Local Lists of Registered Storage Tanks

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 2 SWEEPS UST sites within approximately 0.25 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 02/28/2022 has revealed that there are 3 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.
