GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 01/25/2022
Date Data Arrived at EDR: 02/03/2022
Date Made Active in Reports: 02/22/2022
Number of Days to Update: 19

Source: EPA
Telephone: N/A
Last EDR Contact: 04/01/2022
Next Scheduled EDR Contact: 07/11/2022
Data Release Frequency: Quarterly

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 01/25/2022
Date Data Arrived at EDR: 02/03/2022

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Lists of Federal sites subject to CERCLA removals and CERCLA orders

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 05/25/2021

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

CERS: CalEPA Regulated Site Portal Data

The CalEPA Regulated Site Portal database combines data about environmentally regulated sites and facilities in California into a single database. It combines data from a variety of state and federal databases, and provides an overview of regulated activities across the spectrum of environmental programs for any given location in California. These activities include hazardous materials and waste, state and federal cleanups, impacted ground and surface waters, and toxic materials

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

LOS ANGELES CO LF METHANE: Methane Producing Landfills

This data was created on April 30, 2012 to represent known disposal sites in Los Angeles County that may produce and emanate methane gas. The shapefile contains disposal sites within Los Angeles County that once accepted degradable refuse material. Information used to create this data was extracted from a landfill survey performed by County Engineers (Major Waste System Map, 1973) as well as historical records from CalRecycle, Regional Water Quality Control Board, and Los Angeles County Department of Public Health

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Version Date:	2018

EDR’s GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

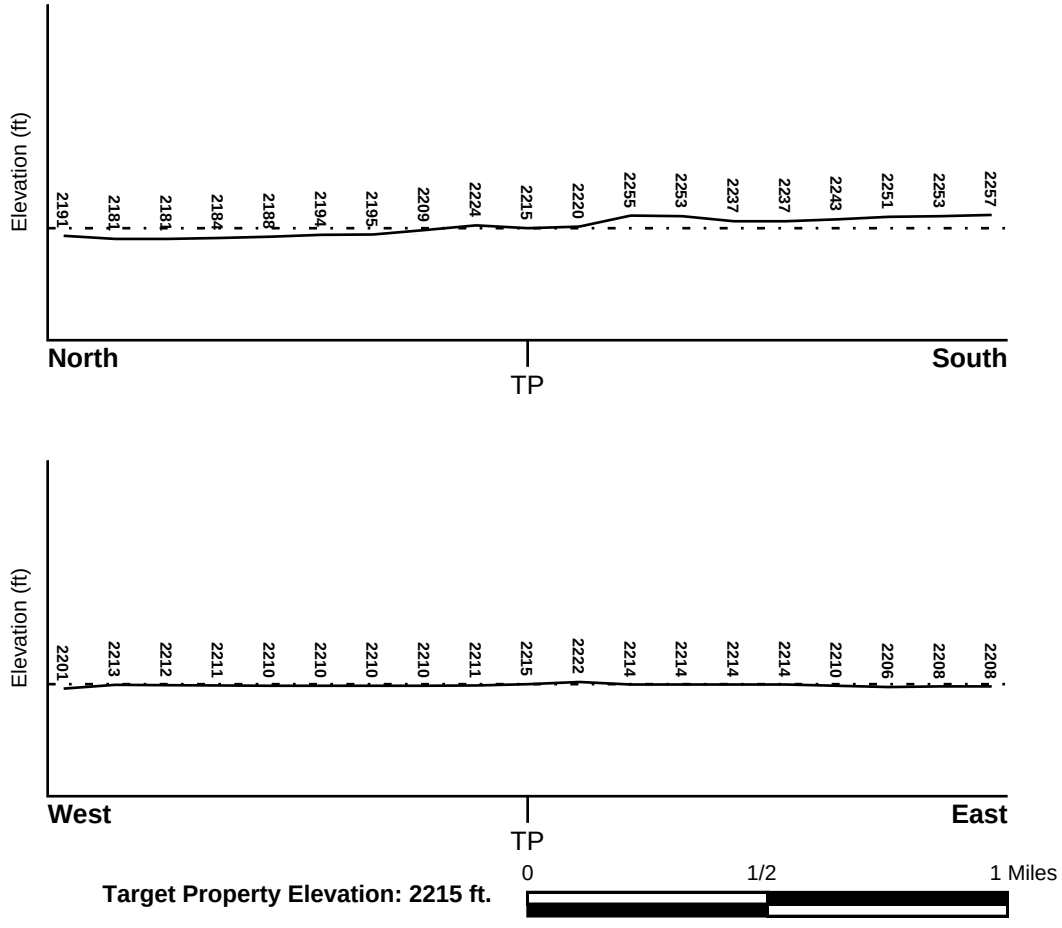
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General North

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06071C3915H	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06071C3900F	FEMA Q3 Flood data
06071C3915F	FEMA Q3 Flood data
06071C4507H	FEMA FIRM Flood data
06071C4526H	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
NOT AVAILABLE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: ROCK OUTCROP

Soil Surface Texture:
Hydrologic Group: Not reported

Soil Drainage Class:
Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	59 inches		Not reported	Not reported	Max: Min:	Max: Min:

Soil Map ID: 2

Soil Component Name: VICTORVILLE

Soil Surface Texture:
Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Moderately well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	16 inches		Not reported	Not reported	Max: 4 Min: 1.4	Max: 8.4 Min: 6.6
2	16 inches	35 inches		Not reported	Not reported	Max: 4 Min: 1.4	Max: 8.4 Min: 6.6
3	35 inches	48 inches		Not reported	Not reported	Max: 4 Min: 1.4	Max: 8.4 Min: 6.6
4	48 inches	59 inches		Not reported	Not reported	Max: 4 Min: 1.4	Max: 8.4 Min: 6.6

Soil Map ID: 3

Soil Component Name: Joshua

Soil Surface Texture: loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	3 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	GC-GM	Max: 141 Min: 14	Max: 8.4 Min: 7.4
2	3 inches	20 inches	gravelly sandy clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	GC-GM	Max: 141 Min: 14	Max: 8.4 Min: 7.4

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
3	20 inches	59 inches	very gravelly coarse sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	GC-GM	Max: 141 Min: 14	Max: 8.4 Min: 7.4

Soil Map ID: 4

Soil Component Name: DUNE LAND

Soil Surface Texture: loam

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

Soil Map ID: 5

Soil Component Name: Cajon

Soil Surface Texture: sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Somewhat excessively drained

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	5 inches	sand	Granular materials (35 pct. or less passing No. 200), Fine Sand.	COARSE-GRAINED SOILS, Sands, Clean Sands, Poorly graded sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 8.4 Min: 7.4
2	5 inches	25 inches	sand	Granular materials (35 pct. or less passing No. 200), Fine Sand.	COARSE-GRAINED SOILS, Sands, Clean Sands, Poorly graded sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 8.4 Min: 7.4
3	25 inches	59 inches	stratified gravelly sand to sand	Granular materials (35 pct. or less passing No. 200), Fine Sand.	COARSE-GRAINED SOILS, Sands, Clean Sands, Poorly graded sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 8.4 Min: 7.4

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish and Wildlife
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

OTHER STATE DATABASE INFORMATION

Groundwater Ambient Monitoring & Assessment Program
State Water Resources Control Board
Telephone: 916-341-5577
The GAMA Program is Californias comprehensive groundwater quality monitoring program. GAMA collects data by testing the untreated, raw water in different types of wells for naturally-occurring and man-made chemicals. The GAMA data includes Domestic, Monitoring and Municipal well types from the following sources, Department of Water Resources, Department of Heath Services, EDF, Agricultural Lands, Lawrence Livermore National Laboratory, Department of Pesticide Regulation, United States Geological Survey, Groundwater Ambient Monitoring and Assessment Program and Local Groundwater Projects.

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

California Oil and Gas Well Locations
Source: Dept of Conservation, Geologic Energy Management Division
Telephone: 916-323-1779
Oil and Gas well locations in the state.

California Earthquake Fault Lines
Source: California Division of Mines and Geology
The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

RADON

State Database: CA Radon

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available city directory data at 5 year intervals.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by MooreTwining Associates, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

EDR Chain of Title

The EDR Chain of Title Report tracks a line of successive owners from the present back to 1940 of a particular parcel of property, linked together by recorded transactions which pass title. Available nationwide, this report provides a summary of a property's ownership history and is a valuable source for determining the prior uses of a property.

A network of professional abstractors following established procedures, uses client supplied address information to locate:

• Historical Chain of Title research

Thank you for your business.

EDR Chain of Title

The EDR Chain of Title Report tracks a line of successive owners from the present back to 1940 of a particular parcel of property, linked together by recorded transactions which pass title. Available nationwide, this report provides a summary of a property's ownership history and is a valuable source for determining the prior uses of a property.

A network of professional abstractors following established procedures, uses client supplied address information to locate:

• Historical Chain of Title research

EDR Environmental Lien and AUL Search

The EDR Environmental Lien and AUL Search Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel information and/or legal description;
- search for ownership information;
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.;
- access a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument(s) (title, parties involved, and description); and
- provide a copy of the deed or cite documents reviewed.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

Please provide details of any investigations of an environmental or geotechnical nature that have been performed by you or by others related to the subject property. If you are not aware of any investigation(s) that have been performed in the past regarding the subject property, whether or not a report was ever prepared and/or issued to you, please so state in the space below.

Not aware

Please provide details of any conditions known to you that could represent an environmental impairment to the subject property other than those items previously noted in this questionnaire. If you are not aware of any conditions, please so state in the space below.

Not aware

To your knowledge, has the property been subject to any regulatory action related to environmental conditions, whether or not a report was issued to you or filed with a regulatory agency. If you are not aware of any actions, please so state in the space below.

Not aware

PLEASE INDICATE IN THE BOXES BELOW IF THE FOLLOWING ITEMS EXIST AND IF YOU ARE ABLE TO PROVIDE THEM
Additional space is provided on page 9

	DOCUMENTS, REPORTS, LISTS, PLANS AND MAPS	Exists/Will Provide Copy	Exists/Will Not Provide Copy	Does Not Exist	Don't Know
1D	Site plans and/or maps that include legal property boundaries				X
2D	Building plans (architectural, utilities and structural)			X	
3D	Hazardous materials inventory				X
4D	Hazardous waste inventory				X
5D	Previously conducted Environmental Site Assessments				X
6D	Reports of subsurface investigations performed on the site including analytical data				X
7D	Reports of subsurface investigations performed on adjacent properties including analytical data				X
8D	Previously conducted geotechnical/ soil investigations at the Site				X
9D	Permits and location of USTs, sumps, pits, and drainage systems				X
10D	Permits and inspection reports for elevators				X
11D	Environmental permits and plans, including hazardous materials management plans, UST closure, etc.				X
12D	Agricultural Chemical Permits				X
13D	Literature or other sources of information regarding operations at the site				X
14D	Individual who may have additional or more complete information regarding uses and activities at the site				X

Additional Questions per ASTM E 1S27-13:

1) Have any environmental cleanup liens been filed or recorded against the Site?

Dont Know

2) Do you have knowledge of any activity and/or land use limitations that are in place on the Site or that have been filed or recorded in a registry?

NO

3) As the user of this Environmental Site Assessment (ESA) do you have any specialized knowledge related to the Site or activities at adjacent properties?

NO

4) Does the purchase price being paid for the Site reasonably reflect the fair market value? If you conclude that there is a difference, have you considered whether the lower price is because contamination is known or believed to be present at the Site?

Yes

5) Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases?

NO

6) As the user of this ESA, based on your knowledge and experience related to the Site, are there any obvious indicators that point to the presence of on Site contamination?

NO

PLEASE PROVIDE DETAILED INFORMATION FOR YES ANSWERS TO QUESTIONS (1A-15A), (1B-13B), (1C-10C)

ADDITIONALLY, PLEASE PROVIDE AN EXPLANATION WHY YOU ARE UNABLE TO PROVIDE (1D-13D) IF THEY EXIST

Additional Questions per ASTM E 1527-13:

1) Have any environmental cleanup liens been filed or recorded against the Site?

NO/UNKNOWN

2) Do you have knowledge of any activity and/or land use limitations that are in place on the Site or that have been filed or recorded in a registry?

UNKNOWN

3) As the user of this Environmental Site Assessment (ESA) do you have any specialized knowledge related to the Site or activities at adjacent properties?

NO

4) Does the purchase price being paid for the Site reasonably reflect the fair market value? If you conclude that there is a difference, have you considered whether the lower price is because contamination is known or believed to be present at the Site?

YES

5) Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases?

NO

6) As the user of this ESA, based on your knowledge and experience related to the Site, are there any obvious indicators that point to the presence of on Site contamination?

NO

DocuSign Envelope ID: 74E8C836-A7FF-45FF-868D-5A0FF44A8ACE

PLEASE PROVIDE DETAILED INFORMATION FOR YES ANSWERS TO QUESTIONS (1A-15A), (1B-13B), (1C-10C)

ADDITIONALLY, PLEASE PROVIDE AN EXPLANATION WHY YOU ARE UNABLE TO PROVIDE (1D-13D) IF THEY EXIST

NA

1. INTRODUCTION

This report presents the design criteria, hydrologic conditions and hydrologic analysis for a proposed 20.7-acre Electric Vehicle (EV) Charging / Logistics Facility to serve light duty/passenger vehicles and medium and heavy-duty trucks and 2) a concrete tilt-up light industrial, warehouse/distribution facility of 1,341,432 square feet in three buildings located on 79.19 acres in Lenwood, San Bernardino County.

The proposed project is located on Lenwood Road between California Highway 58 (CA 58) and Interstate 15 (I-15) surrounded by an area that is planned for significant intermodal, warehouse, and distribution uses. It is directly across the street from industrial zoned land in the City of Barstow and the planned Barstow International Gateway (BIG) project being undertaken by BNSF Railway. The majority of the surrounding parcels are vacant, with the High Desert Estates subdivision located to the south of the project site.

1.1 Site Description

The site is roughly rectangular in shape and covers roughly 96 acres. The site is bounded by Lenwood Road to the west, by vacant land and residential developed properties to the north with Agate Road beyond, by a residential subdivision to the south, and by vacant land to the east. The site consists of rolling terrain generally ranging from about 2,270 feet above mean sea level (AMSL) near the southeast corner of the site to about 2,194 feet AMSL near the northern portion of the site. Several small and shallow washes were noted throughout the site. At the time of the investigation, the site was covered with scattered seasonal vegetation consisting of grasses, weeds, and scattered shrubs. Dirt roads or paths that appeared to be used by offroad vehicles were noted throughout the site, including a path along the western side of the site parallel to Lenwood Road. Loose, sandy soils were noted at the ground surface. This condition made most of the site impassable to heavy two-wheel trucks. Fine to coarse gravel fragments were noted to be scattered across the ground surface.

2. HYDROLOGIC CONDITIONS

Natural drainage on the project site tends to flow in a south westerly to northerly direction due to a ridge running generally south to north along the easterly portion of the property.

Natural slope across the site are approximately two to six percent. There are not any natural drainage courses on the site as flows tend to be sheet flow until reaching the adjacent streets along the west and north portions of the site. The adjacent street along the project is partially improved. Southerly of the site, the street is fully improved including curb and gutter continuing for a short distance southerly of the site.

Natural drainage from the site is northwesterly and northeasterly. The majority of the project site flows northwesterly towards Lenwood Road. Approximately 12 acres of the site flows northeasterly towards an unimproved street. Stormwater flows from the northwestern portion of site continue northerly along Lenwood Road in open channel drainage swales. There are no underground storm drain improvements in the immediate vicinity of the project site.

Some site stormwater run on is anticipated. Approximately 17 acres lying easterly of the project site contributes 36 cubic feet per second. This runoff will be conveyed through the site in an underground storm drain. Most stormwater runoff is diverted due to the previous mentioned ridge line trending north to south along the easterly portion of the project site.

3. PROJECT DESCRIPTION AND PROPOSED STORM DRAIN

The Project's stormwater drainage system will be depicted on the Conceptual Drainage Plan. The Project's on-site stormwater drainage system would consist of catch basins, underground storm drainpipes, underground detention chambers/basins, and a detention basin. The system is designed to collect and detain on-site

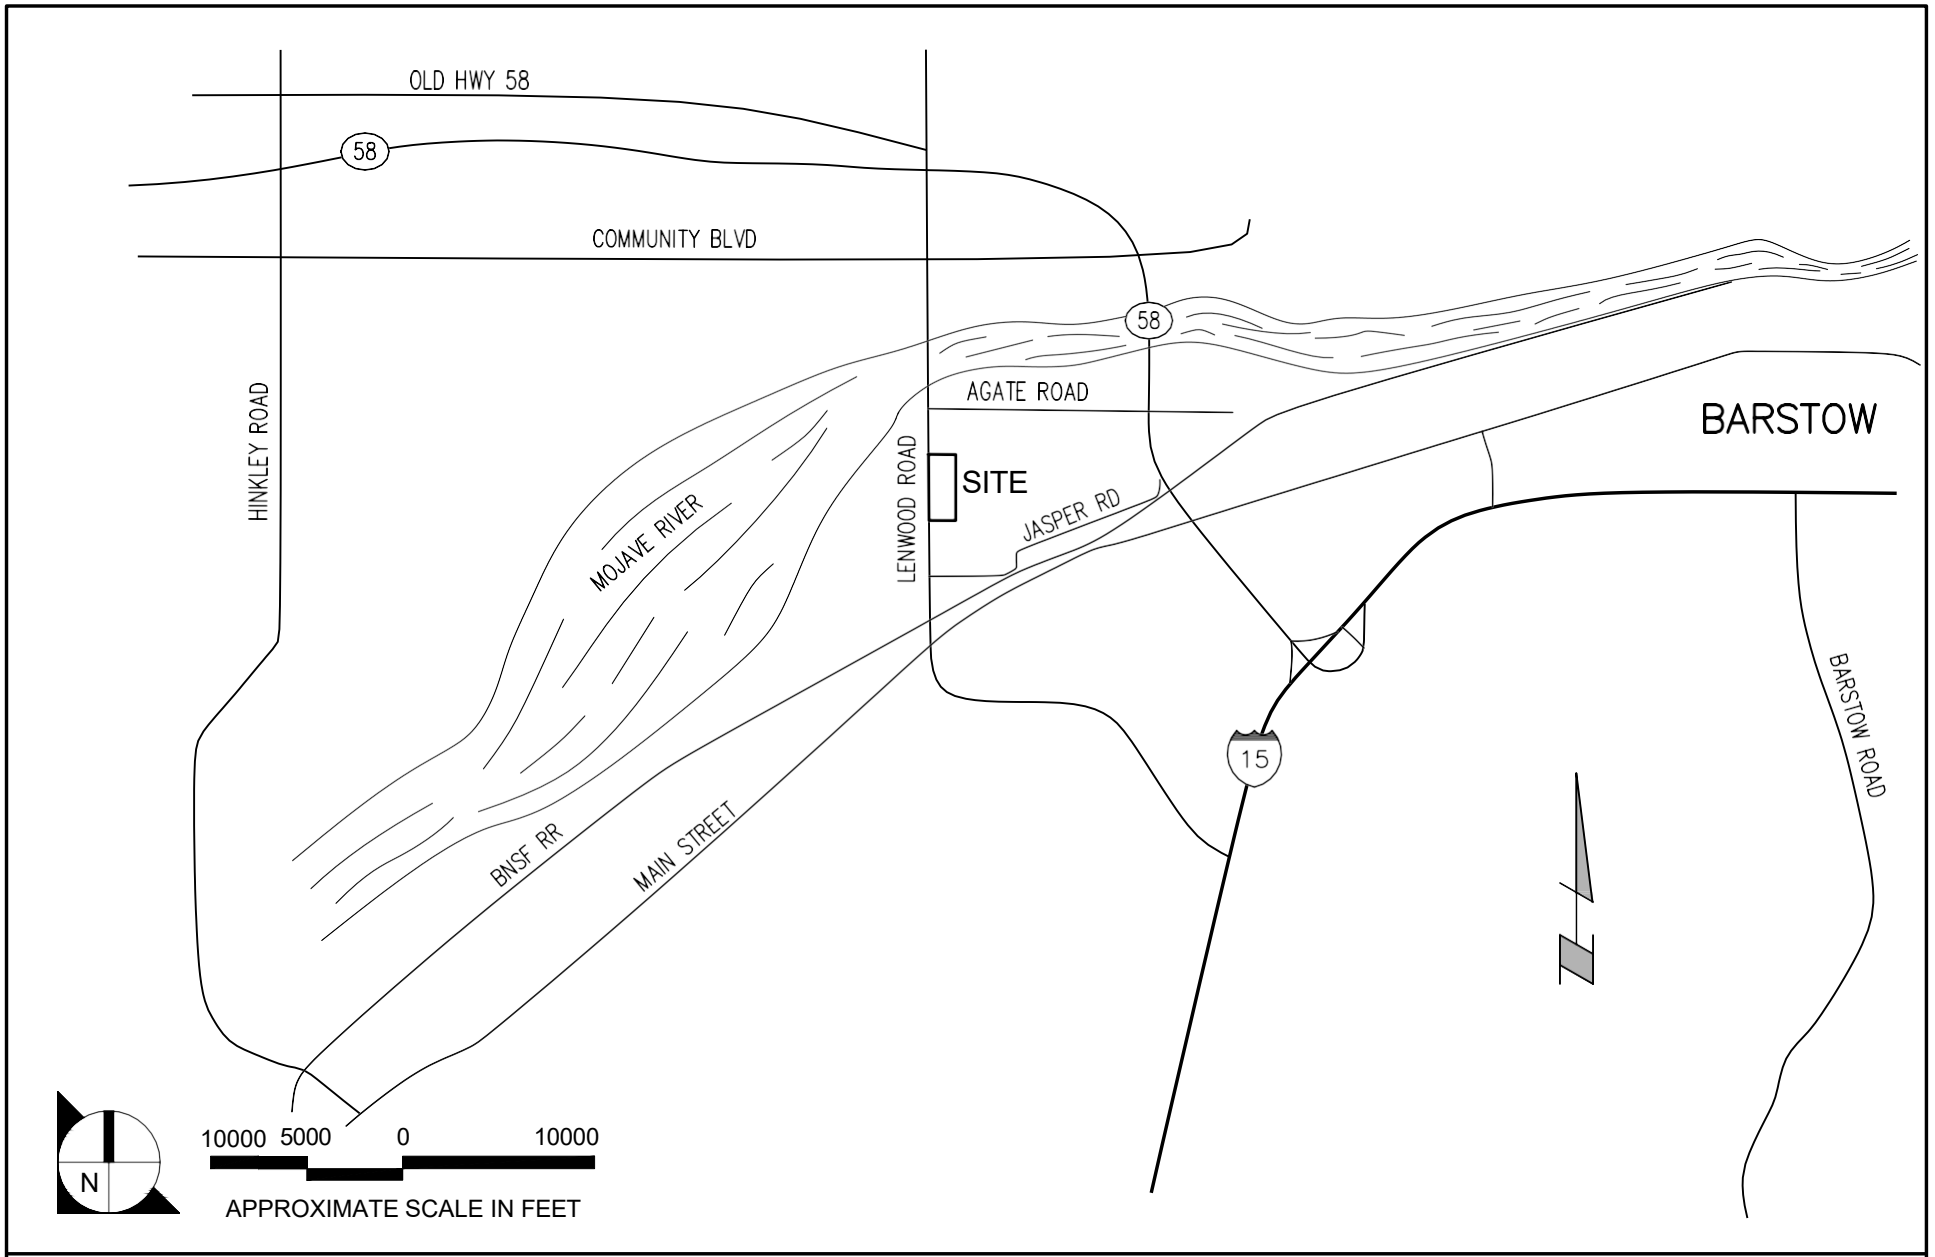

Figure 1.1. Vicinity Map

TRANSTECH

stormwater runoff though\t peak flow attenuation before discharging flows off-site. Attenuated stormwater runoff will be discharged off-site via proposed parkway drains that connect to the proposed gutter system in Lenwood Road and a discharge structure located at the northwesterly corner of the site that will discharge flows to the street gutter. Flows will continue northerly along the easterly side of Lenwood Road as they currently do. Attenuated flows discharged from the detention basin in the northeasterly portion of the site will be discharged to a point along the end of an unimproved street. Approximately 36 cubic feet per second of offsite run-on will be conveyed across the project site though the onsite underground storm, drain system.

The following design parameters are used for the basis of the hydrological analysis.

Table Project Land Use Summary

	Land Use	Hydrologic Soils Group (1) A/B	Hydrologic Soils Group C	AMC	Pervious Surface
		CN	CN		
Existing Site Conditions	Vacant Desert Scrub	82	87	II	100%
Proposed Site Conditions	Electric Vehicle Charging Warehousing and Parking	32	69	II	10%

1) Curve numbers for group A and B have not been completed developed. *USDA "Urban Hydrology for Small Watershed, TR-55."*

NOAA Atlas 14 Rainfall Intensity for a 1-hour, 100-year storm = 1.11 inches.

3.1 Water Quality

The proposed project is not subject to the County's water quality and NPDES requirements and recommendations provided in the San Bernardino County Stormwater Program.

4. FEMA FLOOD PLAIN

The project site lies within FEMA Zone X per FEMA Flood Insurance Rate Map (FIRM) panel 06071C3915J Dated September 2, 2016. Zone X are other areas and are areas determined to be outside the 0.2% annual chance floodplain.

5. SOILS

The soils on the project site are primarily comprised of the Victorville Sandy Loam, Cajon Sand and Rock Outcrop-Lithic Torriorthents. The Victorville series consists of deep, moderately well drained soils that formed in mixed alluvium, dominantly from granitic sources. Victorville soils are on low river terraces and flood plains and have slopes of 0 to 2 percent. The Cajon series consists of very deep, somewhat excessively drained soils that formed in sandy alluvium from dominantly granitic rocks. Cajon soils are on alluvial fans, fan aprons, fan skirts, inset fans and river terraces. Slopes are 0 to 15 percent. The torriorthents-Rock outcrop consists of very shallow, excessively drained soils formed in granitic residuum. The soils are on mountains, hills, and pediments. Slope ranges from 2 to 50 percent.

The soils are somewhat excessively drained with negligible to low runoff and moderately rapid permeability high saturated hydraulic conductivity. The hydrologic soil group for these soils are A, B and C.

6. HYDROLOGY

The results of the onsite Rational Method hydrologic analysis are used herein to present the anticipated pre and post-development peak flow rate runoff conditions for the proposed project as follows:

	Northwesterly Discharge	Northeasterly Discharge	Total
100-Year Existing Condition Peak Flow Rate:	152.4 cfs	32.6 cfs	185.0 cfs
100-Year Developed Condition Peak Flow Rate:	237.8 cfs	57.4 cfs	295.2 cfs
Difference	85.4 cfs	24.8 cfs	

Offsite runoff pass through: 36.0 cfs

7. DETENTION REQUIRMENTS

The project will provide detention volume for stormwater flow attenuation such that the discharge from the post developed condition 100-year storm will not exceed the pre-developed condition 100-year storm peak flow rate.

Northwest Discharge
Area:
Existing Condition: 152.4
Developed Condition: 237.8
Delta Pre-Post: 85.4

Northeast Discharge
Area:
Existing Condition: 32.6
Developed Condition: 57.4
Delta Pre-Post: 24.8

A reduction of 85.4 cfs and 24.8 cfs for the northwesterly and northeasterly discharge locations will be necessary to meet the required storm water attenuation. Approximalely seventeen acres lying easterly of the project produce approximately 36 cfs of run-on. These flows become concentrated at about mid site along the east property line. The offsite flows will be captured and transported across the project site via an underground storm drain system. The offsite flows will be discharged along with the attenuated developed project flows through the outlet structure located at the northwesterly corner of the project site.

7.1 Determination of Detention Capacity Required

Detention of storm water flows will be provided prior to release offsite to the public storm drain system. The required detention capacity required for the project is calculated using the Small Area Unit Hydrograph procedure discussed in Section J of the County of San Bernardino Hydrology Manual. The procedure is applicable to watersheds whose time of concentration is less than 25 minutes.

The unit hydrograph corresponding to the rational method is a triangle with base 2Tc, and a peak occurring at time Tc*.(San Bernardino Hydrology Manual)*

Modified Rational Method Required Storage Vol. = $2Tc\ (Q_{Incremental})$
The estimated total detention volume is estimated as follows:

Northwesterly:
V= 2(ΔQ)(Tc)(60)/2
ΔQ = 85.4 cfs
Tc = 15.3
V = 2(85.4)(15.3)(60)/2 = 78,400 cf

Northeasterly:
V= 2(ΔQ)(Tc)(60)/2
ΔQ = 24.8 cfs
Tc = 18.9
V = 2(24.8)(18.9)(60)/2 = 28,150 cf

The sizing of the individual detention basins are based upon the procedures described in the Federal Highway Administration “Hydraulic Engineering Circular No. 22, Third Edition. Circular No. 22 includes the Triangular Hydrograph Method of estimating storage volume required for peak flow attenuation consistent with San Bernardino county methods.

7.2 Proposed Detention Facilities

The proposed project will provide onsite detention basins designed to restrict the post development design flows to less than the existing condition peak flows as outlined above. The detention basins will consist of a combination of conventional open above ground detention basins and underground chamber detention basins located in each drainage area. The following tables indicates the allowable discharge rate and detention volume requirement for each drainage area.

Detention Basin Typical Calculations

Typical detention basin calculations are provided below on two basins to demonstrate the procedure for the detention basin sizing. The remaining detention basin sizing is summarized in the following tables.

Basin No. 13 Open Detention Basin

1. Determine the estimated detention storage volume.

   Qin = 12.1 cfs
   Qout =7.2 Estimated
   ΔQ = 4.9
   Tc=8.1 min Ti=2(Tc)=16.2 min
   Inflow Volume Vr= Qin(Tc)(60) = 12.1(8.1)(60) =5,881
   Storage Volume Estimate Vs = 0.5Ti(Qi-Qo)60 Eq. 8-1 FHWA Hydraulic Engineering Circular No. 22
   Where:
   Vs = Storage volume
   Vr = Inflow volume
   Qi = Flow into basin
   Qo = Flow out of basin
   Ti = Duration of flow Typically 2Tc
   Tc = Time of concentration
   Tp = Time to peak

   Storage Volume, Vs = 0.5(16.2)(12.1-7.2)60 = 2,381 c.f.
   Actual Storage Volume =1,819 c.f.

2. Calculate the peak flow reduction using the actual storage volume.

Estimated Peak Flow Reduction
Qo/Qi = 1 - .712(Vs/Vr)$^{1.328}$ (Ti/Tp)$^{0.546}$ Eq. 8-5 FHWA Hydraulic Engineering Circular No. 22
= 1 - .712(1819/5881)$^{1.328}$ (16.2/8.1)$^{0.546}$
=1 - .712(0.21)(1.46) = .782
Qo = .782(12.1) = 9.5 cfs Less than 12.1 OK

3. Calculate the actual flow rate released based upon the orifice size of the outlet structure.

   The outlet is a parkway culvert opening is 5.5' wide by 4" high. The ponded water depth is 1.33'
   Q = CA(2gH)$^{0.5}$
   Q = .6(5.5x.33)(64.4x1.16)$^{.5}$
   Q = 9.4 cfs
   Basin No. 13 is providing a peak flow reduction of 12.1 – 9.4 = 2.7 cfs

Basin No. 8 Underground Chambers

1. Determine the estimated detention storage volume.

   Qin = 29.7 cfs
   Qout =14.8 Estimated
   ΔQ = 14.9
   Tc=10.1 min Ti=2(Tc)=20.2 min
   Inflow Volume Vr= Qin(Tc)(60) = 29.7(10.1)(60) =17,998

2. Calculate the peak flow reduction using the actual storage volume.

   Estimated Peak Flow Reduction
   Actual storage volume 7337 cf

   $Qo/Qi = 1 - .712(Vs/Vr)^{1.328} (Ti/Tp)^{0.546}$
   $= 1 - .712(7337/17998)^{1.328} (20.2/10.1)^{0.546}$
   $=1 - .712(0.30)(1.46) = .684$
   Qo = .657(29.7) = 20.3 N.G. Increase Basin volume to 10,797 cf

Actual storage volume: 10,797 cf

$Qo/Qi = 1 - .712(Vs/Vr)^{1.328} (Ti/Tp)^{0.546}$
$= 1 - .712(10797/17998)^{1.328} (20.2/10.1)^{0.546}$
$=1 - .712(0.51)(1.46) = .473$
Qo = .473(29.7) = 14.0 cfs OK

3. Calculate the actual flow rate released based upon the orifice size of the outlet structure.

   The outlet is an 18" pipe with a 1.3' diameter orifice The pond water depth is 6.0'
   $Q = CA(2gH)^{0.5}$
   $Q = .6(1.33)(64.4x5.33)^{.5}$
   Q = 14.8 cfs
   Basin No. 8 is providing a peak flow reduction of 29.7 – 14.8 = 14.9 cfs

Each of the remining underground and above ground detention basins capacity and release is summarized in the following tables.

Table 1. Northwest Discharge of Detention Basin Flow Rates and Volumes

Drainage Area	Area	Qin	Estimated Qout	Tc	2Tc	Total Volume Vr	Estimated Storage Volume Vs	Actual Storage Volume Vs	Estimated Qout	Length of 60" Dia Pipe/Basin Size (L x W)	Actual Qout per office size
1	1.37	5.77	3.4	7.5	15	2,597	1,058	1,767	2.2	90	2.3

(1) Flowrate per orifice flow: $Q=CA(2gH)^{0.5}$

8. HYDRAULIC CALCULATIONS

Hydraulic calculations for pipe sizing and outlet structures for the proposed onsite storm drainage facilities will be prepared with the final storm drain design and specifications.

9. CONCLUSION

The development of the proposed project will increase the 100-year peak flow rate of 185 cubic feet per second to 295 cubic feet per second. As indicated above, the project will provide stormwater detention to attenuate the developed condition peak flow rate to less than that of the pre-developed peak flow rate. The incorporation of several hundred feet of 60-inch diameter underground detention chambers and above ground detention basins will attenuate the peak flow rate as required. See Table 9.1.

The proposed project's storm drain runoff will be discharging into existing stormwater drainage facilities that are maintained by the County of San Bernardino.

The onsite storm drain system will collect runoff in curbs and gutters and flows will be conveyed to the water detention basins. The storm drain discharge at the northwest portion of the site will be through a bubbler outlet since there are no underground storm drains in the vicinity and the relationship of the depth of the onsite storm drain system to the existing street grades along the curb. The excess volume remaining in the storm drain following a storm event will be infiltrated into the underlying soils.

The northeast portion will incorporate a detention basin to attenuate the developed peak flow rate to less than the existing condition peak flow rate. Flows will be discharged to an area currently reserved as a future street.

Table 9.1 Flow and Detention Summary

Drainage Outlet	Existing Flow Rate (cfs)	Developed Condition Flow Rate (cfs)	Attenuated Flow Rate (cfs)
Outlet 1	3.4	5.77	2.3
Outlet 2	9.1	15.3	8.9
Outlet 3	19.1	31.6	17.1
Outlet 4	12.0	20.3	11.6
Outlet 5	10.1	17.1	8.9

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Bernardino County, California, Mojave River Area
Survey Area Data: Version 15, Aug 30, 2023

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Mar 17, 2022—Jun 12, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Appendix I
Noise Technical Memorandum

NOISE TECHNICAL MEMORANDUM

To:	EVC Partners, LLC
From:	Dana Lodico, PE, INCE Bd. Cert., Dudek
Subject:	Noise and Vibration Assessment –Electric Vehicle Charging Station and Logistics Facility Project
Date:	March 6, 2026
Attachments:	Attachment A: Baseline Sound Measurement Field Data Attachment B: Construction Noise Modeling Input and Output Attachment C: Project Traffic Noise Modeling Worksheets

This report contains Dudek's noise and vibration assessment for the Electric Vehicle Charging Station and Logistics Facility (Project), located in San Bernardino County, California (County). The noise and vibration assessment evaluates noise and vibration from Project construction activities, operational noise from on-site stationary sources (e.g., truck wash, HVAC, etc.) and low-speed on-site vehicle movements, and changes to traffic on the surrounding roadway network. The assessment is consistent with the California Environmental Quality Act Appendix G significance criteria checklist regarding applicable local, regional, state, and federal regulations and guidance.

1 Background

1.1 Project Description and Setting

EVC Partners LLC is proposing to construct and operate the Project, a 20.72-acre electric vehicle (EV) charging station to serve light duty/passenger vehicles and medium and heavy-duty trucks and a state-of-the-art concrete tilt-up logistics facility of 1,341,432 square feet in three buildings located on 79.10 acres. The Project would include a commercial building, truck wash and truck maintenance facility to serve users of the EV charging station.

The Project site is located east of Lenwood Road between Jasper Road and Agate Road approximately 4 miles west of downtown Barstow in unincorporated San Bernardino County. A residential neighborhood ("High Desert Estates") adjoins the site to the south and rural residences are also located to the north and east of the site. These areas are also within unincorporated San Bernardino County. To the west, on the other side of Lenwood Road, is land zoned as Industrial per the City of Barstow (City of Barstow 2015).

1.2 Acoustical Fundamentals

1.2.1 Common Terminology

Although the terms may be used interchangeably in the right context, "sound" is defined as any gas or fluid pressure variation detected by the human ear, and "noise" is unwanted sound. The preferred unit for measuring sound is the decibel (dB), which expresses the ratio of sound pressures to a reference value logarithmically and enables a wide range of audible sounds to be evaluated and discussed conveniently. On the low end of this range, zero dB is not the absence of sound energy, but instead corresponds approximately to the threshold of average healthy human hearing; on the upper end, 120–140 dB corresponds to an average person's threshold of pain.

The human ear is not equally responsive to all frequencies of the audible sound spectrum. An electronic filter is normally used when taking noise measurements that de-emphasizes certain frequencies in a manner that mimics the human ear's response to sound; this method is referred to as A-weighting. Sound levels expressed under the A-weighted system are sometimes designated dBA. All sound levels discussed in this report are A-weighted.

The equivalent continuous sound level (L_{eq}) is a single dB value which, if held constant during the specified time period, would represent the same total acoustical energy of a fluctuating noise level over that same time period; this is also known as the "average" sound level. L_{eq} values are commonly expressed for periods of 1 hour, but longer or shorter time periods may be specified. Another descriptor is maximum sound level (L_{max}), which is the greatest sound level measured during a designated time interval or event. The minimum sound level (L_{min}) is the lowest measured level and often called the floor of a measurement period. The statistical sound level (L_{xx}) is a statistical value corresponding with the decibel level exceeded for a cumulative percent (XX%) over a defined time period. The "L-fifty" value (L_{50}) is a decibel level exceeded 50% during a given measurement period (such as 30 minutes out for an hour).

Unlike the L_{eq}, L_{max}, and L_{min} metrics, equivalent day–night sound level (L_{dn}) and community noise equivalent level (CNEL) descriptors always represent 24-hour periods; these metrics differ from a 24-hour L_{eq} value because they apply a time-weighted factor designed to emphasize noise events that occur during the non-daytime hours (when speech and sleep disturbance is of more concern). "Time weighted" refers to the fact that L_{dn} and CNEL penalize noise that occurs during certain sensitive periods. In the case of CNEL, noise occurring during the daytime (7:00 a.m. to 7:00 p.m.) receives no penalty. Noise during the evening (7:00 p.m. to 10:00 p.m.) is penalized by adding 5 dB to the actual levels, and nighttime (10:00 p.m. to 7:00 a.m.) noise is penalized by adding 10 dB to the actual levels. L_{dn} differs from CNEL in that the daytime period is longer (defined instead as 7:00 a.m. to 10:00 p.m.), thus eliminating the dB adjustment for the evening period. L_{dn} and CNEL are the predominant criteria used to measure roadway noise affecting residential receptors. These two metrics generally differ from one another by no more than 0.5–1 dB and are considered equivalent by many jurisdictions.

1.2.2 Exterior Noise Attenuation

Noise sources are classified in two forms: (1) point sources, such as stationary equipment or a group of construction vehicles and equipment working within a spatially limited area at a given time, and (2) line sources, such as a roadway with a large number of pass-by sources (motor vehicles). Sound generated by a point source typically diminishes (attenuates) at a rate of 6.0 dBA for each doubling of distance from the source to the receptor at acoustically "hard" sites and at a rate of 7.5 dBA for each doubling of distance from source to receptor at acoustically "soft" sites (Caltrans 2020). Sound generated by a line source (i.e., a roadway) typically attenuates at a rate of 3 dBA and 4.5 dBA per doubling of distance, for hard and soft sites, respectively (Caltrans 2020). Sound levels can also be attenuated by human-made or natural barriers. For the purpose of a sound attenuation discussion, a hard or reflective site does not provide any excess ground-effect attenuation and is characteristic of paved ground surfaces, as well as very hard-packed soils. An acoustically soft or absorptive site is characteristic of unpaved loose soil or vegetated ground.

For example, in the case of a 65 dBA noise level measured at 25 feet from a roadway centerline (a line source) with hard-packed shoulder (a hard site), an attenuation rate of 3 dBA per doubling of distance would apply; the traffic noise would diminish to 62 dBA at 50 feet from the centerline and to 59 dBA at 100 feet from the centerline. On a construction site (point source) where there is open ground with or without vegetation between the construction equipment and receiver (soft site), an attenuation rate of 7.5 dBA per doubling of distance would apply; the

construction equipment noise, measured as 85 dBA at 50 feet from the construction equipment, would diminish to 77.5 dBA at 100 feet from the source and to 70 dBA at 200 feet from the source.

1.3 Vibration Characteristics

Per the California Department of Transportation (Caltrans) Transportation and Construction Vibration Guidance Manual (Caltrans 2020), vibration is the periodic oscillation of a medium or object. Vibration can be described in terms of displacement, velocity, or acceleration. Heavy equipment operation, including stationary equipment that produces substantial oscillation or construction equipment that causes percussive action against the ground surface, may be experienced by building occupants as perceptible vibration. It is also common for groundborne vibration to cause windows, pictures on walls, or items on shelves to rattle; this transfer of vibration energy in the ground to structures resulting in audible sound is termed groundborne noise. The metric for groundborne noise is the vibration decibel, written VdB. Although groundborne noise in structures from such equipment operation can be intrusive to building occupants, the vibration is seldom of sufficient magnitude to cause even minor cosmetic damage to buildings.

Peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal and is expressed in inches/second (in/sec). PPV is most frequently used to describe vibration impacts to buildings but can also be used to quantify vibration annoyance potential for humans. Caltrans has established a human annoyance vibration threshold of 0.24 in/sec PPV (distinctly perceptible level) for construction-related vibration levels (Caltrans 2020). The Caltrans threshold for potential damage to commercial buildings and newer residential structures is 0.5 in/sec PPV (Caltrans 2020), and for older buildings (historic structures), the threshold is 0.2 in/sec PPV.

1.4 Noise Regulations in San Bernadino County

1.4.1 San Bernadino County Noise Ordinance

Chapter 7 of the County's code of ordinances, Noise Control and Abatement regulates noise in the unincorporated area of the County "to promote the public health, comfort, and convenience of its inhabitants and visitors" (San Bernardino County 2019). Section 24.0704 identifies that Section 83.01.080 of the County code quantifies acceptable exterior noise levels, which appear below in Tables 1 and 2 for stationary and mobile sources, respectively. Additionally, section 24.0706(d) considers construction activity a "special sound source" for which, if occurring between the hours of 7:00 p.m. and 7:00 a.m., would constitute a violation.

Table 1. San Bernardino County Exterior Noise Standards – Stationary Sources

Affected Land Uses (Receiving Noise)	Stationary Sources – Hourly L_{eq} (dBA)	
	Day	Night
Residential	55	45
Professional Services	55	55
Other Commercial	60	60
Industrial	70	70

Source: San Bernadino Code of Ordinances 83.01.080(c)(1), Table 83-2 (San Bernardino County 2014).

Table 2. San Bernardino County Exterior Noise Standards – Mobile Sources

Affected Land Uses (Receiving Noise)	Mobile Sources – L_{dn} or CNEL (dBA)	
	Exterior	Interior
Residential (single and multi-family, duplex, mobile homes)	60	45

Source: San Bernadino Code of Ordinances 83.01.080(d), Table 83-3 (San Bernardino County 2014).
Notes: L_{dn} = day-night sound level, CNEL = community noise equivalent level.

For purposes of this noise assessment, it is assumed that Section 83.01.080(d) noise standards for "adjacent mobile noise sources" relate to offsite roadway traffic and would not pertain to the intermittent occurrence of low-speed movements of trucks or passenger vehicles on the Project site, such as those utilizing the proposed EV charging stations. Instead, noise from these sources are evaluated herein as part of the aggregate Project operations sound emission to the offsite community and assessed for conformance with respect to the stationary noise source standards shown in Table 1. The exterior limit shown in Table 2 would apply to noise from Project-attributed newly added roadway traffic flows on Lenwood Road as received by the adjoining "noise impacted area", as defined by Section 83.01.080(b), comprising the nearest homes of the High Desert Estates residential community.

Sections 83.01.080(g) and 83.01.090(c) of the County Code exempt temporary construction, maintenance, repair, or demolition activities occurring between 7:00 a.m. and 7:00 p.m., except Sundays and Federal holidays, from the County's noise and vibration limits.

1.4.2 San Bernadino County Hazards Element

The Countywide Plan/Policy Plan includes the following policies under Goal HZ-2 "Human-generated Hazards" that pertain to noise considerations (San Bernardino County 2022) applicable to the Project:

- Policy HZ-2.7 Truck delivery areas. We encourage truck delivery areas to be located away from residential properties and require associated noise impacts to be mitigated.
- Policy HZ-2.9 Control sound at the source. We prioritize noise mitigation measures that control sound at the source before buffers, soundwalls, and other perimeter measures.

2 Baseline Sound Level Survey

Four investigator-attended short-term (15-minute) sound pressure level (SPL) measurements and data collected from one unattended long-term (24-hour duration) SPL monitor were conducted as part of a field survey on May 30 and 31, 2024, to quantify and characterize outdoor background sound levels in the vicinity of the Project site. The short-term SPL measurement position (ST-1) was conducted in front of residences to the south of the Project and was selected to evaluate the sound environment at residences to the south and setback from Lenwood Road. Measurement ST-2 was set back 50 feet from Lenwood Road and was selected to evaluate the sound environment near Lenwood Road. Site ST-3 was located north of the Project site, along Agate Road, and was selected to capture sound levels generated at residences to the north. Location ST-4 was situated to the east of the Project site, along Birch Road, and was selected to characterize the sound environment at the residences to the east. Long-term SPL monitor LT-1 was located at the southeastern corner of the site and was selected to document the sound

environment at the nearest residences over a full diurnal period and resulted in a CNEL of 57 dBA. The primary sound sources at all locations included local and distant vehicular traffic, biogenic sounds (birds), and residential sounds (air conditioning units, conversations, barking dogs). See Figure 1 for sound measurement locations. Table 3 summarizes the results of the short-term sound measurements and Figure 2 summarizes the results from the long-term location. Detailed sound level measurement data are included in Attachment A.

Table 3. Short-Term (15-minute) Sound Level Monitoring Results, May 30, 2024

	Measurement Location	Measurement Period (hh:mm)	Primary Noise Source(s)	L_{eq} (dBA)
ST-1	Front of 24958 Camino Del Norte	8:32 a.m.– 8:47 a.m.	Occasional local traffic, distant residential, biogenic, and traffic	50
ST-2	50 feet from center of Lenwood Road	9:00 a.m.–9:15 a.m.	Vehicular traffic, biogenic	53
ST-3	35 feet from center of Agate Road at 25043 Agate Road	9:27 a.m.–9:42 a.m.	Vehicular traffic, distant mechanical and residential	53
ST-4	25 feet from center of Birch Road at 34906 Birch Road	9:59 a.m.–10:14 a.m.	Occasional local traffic, distant residential, biogenic, and traffic	49

Note: L_{eq} = average noise level equivalent; dBA = A-weighted decibel.

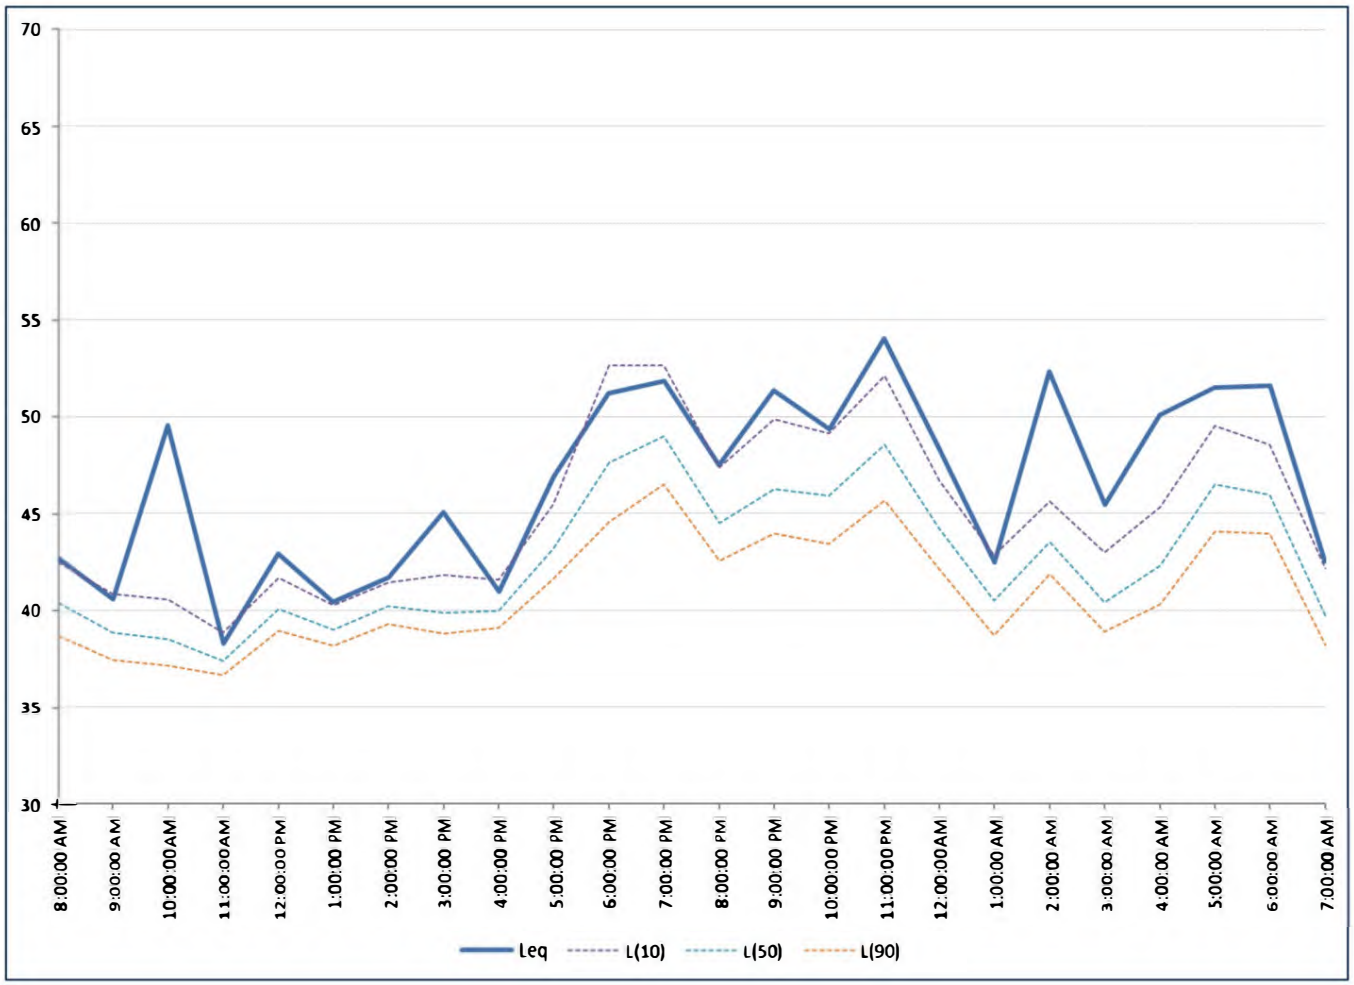

Figure 2. Summary of Long-term Sound Level Monitoring Results at LT-1

3 Impact Assessment

3.1 Significance Thresholds

To assess the potential for significant noise impact to the community, Appendix G of the current California Environmental Quality Act Guidelines requires consideration of whether a project would result in:

1. A substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.
2. The generation of excessive groundborne vibration or groundborne noise levels.
3. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, the exposure of people residing or working in the project area to excessive noise levels.

3.2 Threshold 1 – Substantial Temporary or Permanent Increase in Ambient Noise Levels

3.2.1 Construction Noise

One of the most extensive and widely used databases for sound levels from motorized or powered construction equipment is the Noise Source Database developed under National Cooperative Highway Research Program 25-49 (NCHRP 25-49), Development of a Highway Construction Noise Prediction Model (NASEM 2022). While the focus of data compilation was for equipment that would typically be employed for the construction of transportation facilities, the list is comprehensive enough to be useful in assessing sound levels for nearly every activity for which powered equipment is used. Table 4 provides a list of the maximum sound levels generated by various powered equipment that could be associated with construction of the Project.

Table 4. Selected Powered Equipment Noise Emission Levels

Equipment	Average Sound Level (dBA L_{eq}) – 50 feet from Source	Maximum Sound Level (dBA L_{max}) – 50 feet from Source
Air Compressor	66	67
Aerial Lift (Man Lift)	72	73

Table 4. Selected Powered Equipment Noise Emission Levels

Equipment	Average Sound Level (dBA L_{eq}) – 50 feet from Source	Maximum Sound Level (dBA L_{max}) – 50 feet from Source
Loader	72	81
Paving - Asphalt	—	83
Paving - Concrete	85	88
Pump	73	74
Scraper	—	92
Flatbed Truck	—	74
Welding Machine	71	72

Source: NASEM 2022.
Notes: dBA = A-weighted decibel; L_{eq} = average noise level equivalent; L_{max} = maximum instantaneous noise level; — = Equipment without average (L_{eq}) noise levels are non-stationary and best represented only by maximum instantaneous noise level (L_{max}).

The equipment sound levels presented in Table 4 include both average (L_{eq}) and maximum (L_{max}) sound levels, measured at a distance of 50 feet using a "slow" response time constant (1 second). Usually, construction equipment operates in alternating cycles of full power and low power, producing average noise levels over time that are less than the maximum noise level. The average sound level of construction activity also depends on the amount of time that the equipment operates and the intensity of construction activities during that time. Noise emissions from the construction of the Project were estimated based upon default construction scenario information provided by the California Air Resources Board (CARB) California Emissions Estimator Model (CalEEMod) (Version 2016.3.1) for the type and size of proposed development and included phasing, equipment mix, and vehicle trips. The construction equipment mixes used for estimating the Project-generated construction noise emissions are shown in Attachment B.

Construction Equipment Inventory

CalEEMod was used to identify the construction equipment anticipated for development of the Project, including earthwork, utility trenching and equipment installation, and paving activities. The equipment list is based upon the detailed project description; CalEEMod identified the anticipated equipment shown in Table 5 for each phase of the Project construction. Construction vehicle trip estimates were provided by conversations with a local construction company with substantial experience with similar projects in the region.

Table 5. Construction Equipment Per Phase

Construction Phase	On Site Equipment Types (and Quantities)	Vehicle Type (One-way Trip Quantities per Day)
Site Preparation	Dozers (3), Backhoe (4)	Autos (18), Vendor Trucks (2)
Grading	Graders (1), Excavator (2), Scraper (2), Dozer (1), Backhoes (2)	Autos (20), Vendor Trucks (2)
Underground Utilities	Excavator (4), Trencher (1), Trucks (4), Plate Compactor (3), Loader (1), Skid Steer Loader (4)	Autos (30), Vendor Trucks (4)
Building Construction	Cranes (1), Generators (1), Forklifts (3), Backhoes (3), Welders (1)	Autos (150), Heavy Trucks (60)

Fine Grading	Graders (1), Excavator (2), Scraper (2), Dozer (1), Backhoes (2)	Autos (70), Vendor Trucks (8)

On-Site Construction Noise Assessment

With the Project construction equipment identified in Table 5 above, an analysis was performed with a Microsoft Excel–based noise prediction model using the National Cooperative Highway Research Program reference data shown in Table 4. Input variables include the equipment type (backhoe, crane, truck, etc.), the number of equipment pieces, the duty cycle for each piece of equipment (i.e., percentage of each hour the equipment typically works), and the distance from the sensitive receptor. Refer to Attachment B for the construction modeling inputs and results. Construction noise levels were predicted at the nearest sound-sensitive land uses (i.e., residences) in each direction from the Project site, based on the distance between the closest Project construction boundary and these residences. Aggregate sound emissions from Project construction activities, broken down by sequential phase of construction, were predicted for the worst-case construction activity occurring along the closest construction boundary to the off-site closest sensitive receptors.

Construction activities occurring between 7:00 a.m. and 7:00 p.m. are exempt from the County's noise limits per Section 83.01.080(g)(3) of its code. Noise-sensitive uses in the general vicinity of the Project site include suburban and rural residences adjoining the site to the south and located 250 and 1,700 feet to the north and east of the project boundary, respectively. The distance from the center of the site to the nearest residences is about 1,600 feet. Using the provided construction information and the distance identified from the edge of a future construction zone boundary to the closest receivers, the construction noise model was used to predict sound levels from on-site construction activities. The construction noise was modeled at distances representative of the closest noise-sensitive receptors to the Project site. The results are summarized in Table 6.

Table 6. Construction Noise Levels, Worst-Cases

Task/Activity	Sound Level When Adjacent to Residence (50 feet)	Sound Level from Center of Site to Closest Residence (1,600 feet)
	$L_{eq\ 8hr}$	$L_{eq\ 8hr}$
Site Preparation	87	56
Grading	92	62
Underground Utilities	85	55
Building Construction	90	60
Paving	92	62
Architectural Coating	66	36
Fine Grading	92	62

Note: $L_{eq\ 8hr}$ = average noise level equivalent over an 8-hour period.

Table 6 presents the results of the construction noise prediction, assuming all equipment is simultaneously operating along the Project site boundary closest to the identified receiver and assuming an average sound level with equipment operating at the center of the site. As indicated in Table 6, worst-case construction noise levels would range from 66 to 92 dBA $L_{eq\ 8hr}$. However, this scenario is highly unlikely as construction is unlikely to be co-located at the worst-case location for an entire 8-hour period. Sound levels at the closest residential receiver when construction is at the center of the site would range from 36 to 62 dBA $L_{eq\ 8hr}$. Additionally, there is an existing 6-foot-high sound wall located at the southern Project boundary. This wall would reduce construction sound levels at homes to the south by up to 5 dB. With construction of an approximately 200-foot

long 8-foot-high barrier proposed along the westerly end of the southern boundary as part of the Project, construction sound levels at homes to the south would be reduced by up to 8 dB (see Figure 3)

Construction would occur during hours (7:00 a.m. and 7:00 p.m.) that are exempt from the County's noise limits. The average noise levels at exterior areas would not be harmful, nor would they present a deterrent to use of outdoor activity, yard, or patio areas. With typical outdoor to indoor attenuation of 15 dBA for standard construction residential structures with windows open, interior noise levels at the closest residences during average construction would be approximately 21 to 47 dBA L_{eq}, which should not interfere with conversation or other daytime activities indoors. Consequently, on-site construction noise levels would result in a **less than significant** temporary noise impact.

Off-Site Construction Traffic Noise Assessment

One-way vehicle trips per day during each phase of construction are provided in Table 5, based on conversations with a local construction company with substantial experience in the region. Construction traffic would utilize Lenwood Road to access the site. Based on existing traffic counts, Lenwood Road currently carries 209 vehicles per hour during the AM peak hour and 300 vehicles per hour during the PM peak hour (AimTD, 2023).

The analysis assumes that all light vehicle construction trips would utilize Lenwood Road, traveling south towards Jasper Road. Heavy trucks would be split, with 40% of trucks traveling south towards Jasper Road and the other 60% traveling north and away from residences. Assuming that all trips would occur during the AM and PM peak hours, the highest peak hour construction volume along the portion of Jasper Road with adjacent sensitive receptors would be 75 light vehicles (half of 150) and 12 heavy trucks (half of 24, which is 40% of 60), occurring during building construction. A typical heavy truck is approximately 10 dB louder than a light vehicle; therefore, one heavy truck would be acoustically equivalent to 10 passenger vehicles.[1] The equivalent construction traffic volume would therefore be equivalent to 195 light vehicles (accounting for 75 autos and 12 heavy trucks). An increase of 195 vehicles per peak hour on a roadway with existing peak hour traffic volumes of 209 to 300 would result in a peak hour increase of about 2.2 to 2.9 dB.[1] This increase would be below the increase that would be considered barely perceptible (3 dB). This is a **less than significant** temporary noise impact.

3.2.2 On-Site Operational Noise

Methodology

Sound modeling of Project operations was conducted in accordance with relevant algorithms and reference data from International Organization of Standardization (ISO) 9613-2, Acoustics – Attenuation of Sound During Propagation Outdoors, Part 2: General Method of Calculation, implemented using Datakustik's CadnaA software application. The CadnaA model takes into account source sound power levels, surface reflection and absorption, atmospheric absorption, geometric divergence, meteorological conditions, walls, barriers, berms, and terrain. The Project area was modeled with a ground acoustical absorption factor "G" equal to 0.8 to represent a desert floor with loose sand and some vegetation. A temperature of 10°C with 70% relative humidity was used. No attenuation due to foliage was included.

Sound sources modeled for the Project were major producers of continuous-type noise generation, which include heating, ventilation, and air conditioning (HVAC) units for the three warehouse buildings (98 dBA sound power level

[1] Based on a 10 log scale. Note that a doubling of traffic volumes results in an approximately 3 dB increase.

each) and one commercial building (72 dBA), the truck wash (97 dBA), two transformers (72 dBA each), four battery storage units (85 dBA each), four prepackaged wastewater treatment plants[2] (71 dBA each), 45 electric vehicle DC fast charging units at the truck hub (80 dBA each), and 8 light duty DC fast charging units at the commercial building. The Project also proposes Level 2 EV chargers throughout the employee parking spaces at the logistics center. These are not anticipated to generate sound levels that would be perceptible off-site and are therefore not included in the modeling. The HVAC reference sound levels were calculated based on the building square footage and usage and manufacturer sound power level data (see Appendix D) and the other equipment levels were based on data from Dudek files with similar equipment that is anticipated to be installed for this Project. Additionally, 35 trucks traveling on-site along the site's truck route to the warehouse and 132 truck trips along the truck service route were included, as this is the maximum on-site truck volume that is anticipated to occur. These truck volumes were assumed to occur for both daytime and nighttime hours, although it is likely that nighttime truck trips would be lower.

There is an existing 6-foot-high sound wall located at the southern Project boundary. A 6-foot-tall masonry wall is proposed along the north and east sides of the project site and an 8-foot-tall masonry wall, approximately 200 feet long, is proposed along the western portion of the southern boundary of the project site. These walls were included in the sound propagation modeling for Project operations.

Sound-sensitive uses in the general vicinity of the Project site include suburban and rural residences adjoining the site to the south and located 250 and 1,700 feet to the north and east, respectively. Sound modeling included multiple discrete off-site receiver locations. In addition, a map of predicted iso-pleths, depicted as color-coded area regions representing 5-dB-wide decrements of sound propagation, was calculated across a surface, vertically parallel with and 1.5 meters (5 feet) above modeled topography and across an area spanning the Project and its immediate surroundings.

Prediction Results

The model results are presented graphically in Figure 3, Sound Modeling Results for Project Operations, and numerically in Table 7.

Table 7. Modeled Project Operation Sound Levels Compared to County Code Limits

Model Receiver	Land Use	Modeled Project Operational Sound Level (dBA $L_{eq\ 1hr}$)	Day / Night County Code Limits (dBA $L_{eq\ 1hr}$)	In Compliance with Day and Night dBA Limits?
R1	Residential	43	55 / 45	Yes / Yes
R2	Residential	43	55 / 45	Yes / Yes
R3	Residential	41	55 / 45	Yes / Yes
R4	Residential	36	55 / 45	Yes / Yes
R5	Residential	34	55 / 45	Yes / Yes
R6	Residential	30	55 / 45	Yes / Yes
R7	Residential	31	55 / 45	Yes / Yes
R8	Residential	31	55 / 45	Yes / Yes

[2] A sewer connection to the City of Barstow is the preferred method for addressing project wastewater. However, on-site treatment is considered as an option if City service is infeasible, and is therefore analyzed here.

Table 7. Modeled Project Operation Sound Levels Compared to County Code Limits

Model Receiver	Land Use	Modeled Project Operational Sound Level (dBA $L_{eq\ 1hr}$)	Day / Night County Code Limits (dBA $L_{eq\ 1hr}$)	In Compliance with Day and Night dBA Limits?
R9	Residential	30	55 / 45	Yes / Yes
R10	Residential	37	55 / 45	Yes / Yes
R11	Residential	38	55 / 45	Yes / Yes
R12	Residential	39	55 / 45	Yes / Yes

Notes: dBA = A-weighted decibel; $L_{eq\ 1hr}$ = average noise level equivalent over a 1-hour period; L_{eq} = average noise level equivalent.

Sound sensitive locations, in the form of suburban and rural residences, are located north, east, and south of the site. As indicated in Table 7, the highest sound level exposure at a residence would be 43 dBA L_{eq}. Operational sound levels would be well below the normally acceptable daytime and nighttime noise limits of 55 and 45 dBA, respectively, as established in the Countywide Plan/Policy Plan and County Code (as introduced in Section 1.4). As a result, Project operational noise levels would be **less than significant**.

FIGURE 3

On-site Operational Sound Levels

Lenwood EV Charging Station and Logistics Facility

3.2.3 Off-Site Operational Traffic Noise

Methodology

Using California Department of Transportation (Caltrans) guidance, the average daily traffic (ADT) associated with introduction of the Project for the segment of Lenwood Drive adjacent to the High Desert Estates residential community and immediately south of Project Driveway 8 was estimated to be ten times the peak hour volumes as appearing in Figure 12 and Figure 13 (without using the PCE calculation) of the Local Traffic Assessment (LTA) (Dudek 2025). Furthermore, and consistent with Caltrans guidance as a "typical case" (Caltrans 2013) and the LTA and for purposes of predicting CNEL at 50 feet perpendicular distance from the roadway, this analysis assumes 85% of the ADT occurs during daytime hours (7:00 a.m. to 10:00 p.m.) and 15% during the nighttime hours (10:00 p.m. to 7:00 a.m.). Worksheets accompanying this memorandum as Attachment C show these and other input parameters as part of traffic noise prediction for both the peak hour morning and peak hour afternoon cases.

Prediction Results

Using the peak hour morning and peak hour afternoon volumes, predicted Project traffic noise exposures to the nearest backyards (i.e., exterior use areas) of the High Desert Estates residential properties are expected to be less than 60 dBA CNEL and thus comply with the County's exterior noise threshold (per Table 2) and consequently be considered a **less than significant impact**.

3.3 Threshold 2 – Generation of Excessive Groundborne Vibration

3.3.1 Construction Vibration Assessment Methodology

Construction activity can result in varying degrees of ground vibration at local receptors, depending on the equipment and methods used, distance to the affected structures, and soil type. Caltrans has been assembling data for groundborne vibration levels generated by heavy construction equipment operation during the building of transportation projects for many years. The vibration levels from use of such equipment are representative for other types of construction efforts, not just transportation projects, and are therefore widely employed to assess vibration levels from heavy equipment use for any effort. According to Caltrans (2020), the most important equipment relative to generation of vibration, and the vibration levels produced by such equipment, is illustrated in Table 8.

Table 8. Vibration Velocities for Typical Construction Equipment

Equipment	PPV at 25 Feet (Inches Per Second)
Vibratory Roller	0.210
Large Bulldozer	0.089
Loaded Trucks	0.076
Small Bulldozer	0.003

Source: Caltrans 2020.
Note: PPV = peak particle velocity; VdB = vibration decibel.

Groundborne vibration attenuates rapidly, even over short distances. The attenuation of groundborne vibration as it propagates from source to receptor through intervening soils and rock strata can be estimated with expressions

found in Caltrans guidance (Caltrans 2020). The following equation is used to calculate PPV at any distance of interest from the operating construction equipment.

$$PPV_{rcvr} = PPV_{ref} * (25/D)^{1.1}$$

In the above equation, PPV_{rcvr} is the predicted vibration velocity at the receiver position, PPV_{ref} is the reference value at 25 feet from the vibration source (as listed in Table 8), and D is the actual horizontal distance to the receiver.

3.3.2 Vibration Assessment

The County exempts construction activities occurring during the County's allowable hours (7:00 a.m. to 7:00 p.m. on weekdays and Saturdays) from the County's vibration standards. However, to ensure that project construction does not result in structural damage to nearby buildings, it is appropriate to employ a numeric standard adopted by another agency. The California Department of Transportation (Caltrans 2020) establishes a construction-related damage limit of 0.25 in/sec PPV for historic and old buildings, 0.3 in/sec PPV for older residential structures, and 0.5 in/sec PPV for new residential and modern commercial/industrial structures. The applicable threshold for Project-attributed construction vibration would be 0.3 in/sec PPV at the closest residences. Thresholds for annoyance are not typically used to identify impacts for short-term construction under CEQA. However, for informational purposes, Caltrans has established a human annoyance vibration threshold of 0.24 in/sec PPV (distinctly perceptible level) for construction-related vibration levels (Caltrans 2020).

The closest sensitive structures are residences that adjoin the site to the south, with the residential buildings located about 25 feet from the southern Project boundary. Given the location of the southern boundary soundwall, it is assumed that heavy construction equipment would be located at least 5 feet from the southern boundary. At this distance (30 feet), construction vibration levels would be 0.17 in/sec PPV or less. Project construction-related vibration levels could be perceptible at the nearest structures when construction is located adjacent to the southern Project boundary but would be below the Caltrans threshold (0.3 in/sec PPV) and below the human annoyance level of 0.24 in/sec PPV.

Project construction would result in groundborne vibration levels that would meet the applicable significance thresholds at the closest sensitive structures (residences to the south). Groundborne vibration impacts of the Project would therefore be **less than significant**.

3.4 Threshold 3 – Exposure of People Residing or Working in the Project Area to Excessive Airport Noise Levels

There are no private or public airports within 2 miles of the site and the Project site would not expose construction workers or operations employees to substantial airport noise. **No Impact.**

APPENDIX

A EV Charging Truck Stop/Auto and Distribution Center Vehicle Miles Traveled Analysis

1 Introduction

1.1 Purpose and Scope of the TIS

The purpose of this Transportation Impact Study (TIS) is to identify potential transportation-related impacts associated with the proposed Electric Vehicle (EV) Charging Station and Logistics Facility Project (project) to be located on Lenwood Road between California State Route 58 (SR-58) and Interstate 15 (I-15) in San Bernardino County (Figure 1, Project Location). This TIS has been prepared per the San Bernardino County Transportation Impact Study Guidelines (San Bernardino County 2019), the San Bernardino County Transportation Authority's (SBCTA) Congestion Management Program (CMP) (SBCTA 2016) and Caltrans Transportation Impact Study Guide (Caltrans 2020). In addition, this TIS complies with the City of Barstow General Plan Circulation Element (City of Barstow 2015).

The objectives of this TIS are to:

- Document existing roadway, pedestrian, bicycle, and transit conditions in the study area;
- Estimate the trip generation for the proposed project on a daily, AM, and PM peak hour basis;
- Provide a Vehicle Miles Traveled (VMT) analysis per Senate Bill 743, the California Environmental Quality Act (CEQA) Guidelines, and the San Bernardino County Transportation Impact Study Guidelines; and
- Identify CEQA-required mitigation measures for significant transportation impacts.

1.2 Project Description

The approximately 100-acre Project site includes four parcels (049-714-203, 049-714-204, 049-714-214, and 049-714-215) and is located on Lenwood Road between CA 58 and Interstate-15, approximately one mile west of CA 58 and four miles west of downtown Barstow. The Project site is undeveloped and surrounded by undeveloped lands with the exception of rural residential properties to the north and a single-family residential neighborhood, High Desert Estates, located adjacent to the southern Project boundary.

The project site plan is provided as Figure 2, and a summary of the proposed land uses is presented in Table 1. The Project is proposing development on approximately 20-acres in the southern portion of the site with an electric vehicle (EV) charging hub for light duty/passenger vehicles and medium and heavy-duty trucks. The site will have a range of EV chargers to serve different charging needs (e.g., automobiles vs medium and heavy-duty trucks; slower chargers for overnight truck charging vs: fast charging for trucks, etc.). The EV charging station will include a commercial building of up to 15,000 square feet (SF) that will contain ancillary uses (e.g., food, convenience services, amenities for site users, etc.) for those using the station, as well as for local residents and nearby light industrial uses. The remaining site is proposed to include three warehouse buildings of 447,144 SF each, for a total of 1,341,432 SF of light industrial warehouse, logistic, and distribution facilities. Access would be provided from Lenwood Road via eight driveways, with a four-lane internal road provided between the EV charging station and the logistics facility. Section 8 provides further information about the proposed site access and frontage improvements.

Table 1. Summary of Proposed Project Components

	Land Use	Size
EV Charging Station	Truck Chargers	45 chargers
	Auto Chargers	8 chargers
	Truck Wash	6,000 SF; 2 lanes
	Truck Maintenance	4,000 SF; 4 bays

2 Study Area

This section provides a summary of the existing street network, including the major roadways serving the site, the existing transit service, and bicycle and pedestrian facilities in the study area.

2.1 Existing Street Network

Figure 3 provides the County of San Bernardino Roadway Network and Figure 4a provides the City of Barstow General Plan Roadway Network. The City is in the process of updating their General Plan and associated circulation maps. A map of the City's proposed roadway network is provided as Figure 4b and a map of the City's proposed goods movement routes is provided as Figure 5 (City of Barstow 2025). Characteristics of the primary roadways within the study area are described below.

- I-15 is a north-south, divided, four to eight-lane freeway classified as a major interstate freeway that begins near the Mexico—US Border and extends to Alberta, Canada, and serves as a critical connection for many other regional roadways, freeways, and highways. Caltrans classifies I-15 as a designated truck route. The nearest interchange to the site is provided at I-15 and Lenwood Road, approximately 3.25 miles south of the site.
- State Route 58 is a four-lane east-west divided highway which currently has its eastern terminus at the I-15 freeway in south Barstow. SR-58 provides regional access westerly to Bakersfield and northern California cities. The nearest interchange to the site is provided at SR-58 and Lenwood Road, approximately 1.5 miles north of the site. SR-58 is a designated truck route in the City of Barstow Circulation Element.
- Community Boulevard is an east-west two-lane roadway between Hinkley Road to the west and Old Highway 58 to the east. Community Boulevard is designated as a Collector in the City of Barstow Circulation Element.
- Lenwood Road is a north-south two to four-lane road designated as a Major Highway in the County's Roadway Network and a Primary Arterial in the City of Barstow Circulation Element. Lenwood Road is proposed as an Industrial Arterial as part of the City's General Plan update (City of Barstow 2025). Lenwood Road serves the west end of Barstow; with an interchange at I-15, and intersects west Main Street in the unincorporated community of Lenwood. North of Main Street it crosses the Mojave River and the BNSF Railroad to link with SR-58. South of I-15, Lenwood Road was extended to the old Sidewinder Road interchange. This new roadway, named Outlet Center Drive, provides a secondary access to the Lenwood Road/I-15 Freeway interchange commercial area. Portions of Lenwood Road, near the I-15 interchange and commercial areas and near Main Street have been fully improved with sidewalks, curb and gutter, and widened to four lanes, with left turn pockets at major intersections.
- Agate Road is a two-lane local road between Lenwood Road to the west and Western Drive to the east. Agate Road serves the residential neighborhoods to the north and east of the project site.
- Jasper Road is a two-lane local road between Roadrunner Road to the west and Pettit Road to the east. East of Pettit Road, Jasper Road traverses north-south where it terminates at Agate Road to the north.
- Main Street (old U.S. Highway 66) is the key east-west arterial through the City of Barstow and is designated as a Major Highway in the County's Roadway Network and as a Primary Arterial in the City of Barstow Circulation Element. Main Street is also a designated truck route in the City of Barstow Circulation Element. It currently has interchanges with I-15 and I-40. West of Lenwood Road, the roadway becomes National Trails Highway and provides local access to the Helendale/Oro Grande areas. This roadway also serves as an alternative route for I-15 south to Victorville.

2.2 Transit System

The City of Barstow (and its sphere of influence) is served by bus services provided by the Victor Valley Transit Authority (VVTA), which provides regional and local services throughout Victor Valley. Regionally, the City is served by passenger rail services offered by the National Railroad Passenger Corporation (Amtrak). The rail and transit providers are described below.

Victor Valley Transit Authority

VVTA provides local bus service for the communities of Adelanto, Apple Valley, Barstow, Helendale, Hesperia, Victorville, and unincorporated areas of San Bernardino County. VVTA operates five local bus routes in Barstow, providing bus connections between City Hall, shopping centers, schools and colleges, and residential areas. Route 3 shown in Figure 6, Existing Transit Facilities, is the closest bus route to the project site, with bus stops near the corner of Lenwood Road and Camino Del Sol, approximately 315 feet south of the project site, and near the corner of Lenwood Road and Agate Road, approximately 675 feet north of the project site. The route operates weekdays, between 6:00 a.m. and 7:50 p.m., Saturday and Sunday between 8:00 a.m. and 4:50 p.m. (VVTA 2023).

VVTA also provides commuter service between Barstow and Fort Irwin and regional service between Barstow, Victorville and San Bernardino, and Barstow, Hinkley and Helendale.

VVTA also offers paratransit services for persons with special needs on any paved street within Barstow as long as it is within their service boundaries. The VVTA paratransit services do not travel a fixed route and provide a flexible alternative to the fixed bus routes (VVTA 2023).

Amtrak

Amtrak is a national rail operator, with 21,000 route miles in 46 states, the District of Columbia, and three Canadian Provinces. The closest passenger rail station is the Barstow Amtrak Station, located at 650 North First Avenue in Barstow, located approximately six miles east of the project site. The Barstow Amtrak Station is part of the Southwest Chief Route, an east-west rail line extending from Los Angeles, California, to Chicago, Illinois (Amtrak 2023).

2.3 Pedestrian and Bicycle Facilities

The project site is primarily surrounded by vacant land (except for residential to the north and south) with limited pedestrian or bicycle infrastructure provided. Where new development has occurred, sidewalks typically have been constructed along project site frontages and within residential developments. A sidewalk is provided on the west side of Lenwood Road, along the frontage of the Valmont Utility company, immediately south of the project site. As the adjacent areas surrounding the project site continue to develop, pedestrian access will be improved.

Figure 7 presents the County's Bicycle and Pedestrian Planning Policy Map and Figure 8a presents the City's existing bicycle routes, and Figure 8b presents the City's proposed bicycle network. As shown in the figures, Class II bicycle lanes (painted on-street lane) are proposed on Lenwood Road, between Agate Road to the north and Main Street to the south, and between High Point Parkway and Mercantile Way. This includes the segment of Lenwood Road along the project frontage. Class II bicycle lanes are also proposed on Main Street in the vicinity of the site. An east-west equestrian trail is also proposed south of Community Boulevard beginning near the western City limits and continuing east to the eastern City limits (San Bernardino County 2018).

3 Project Trip Generation

The estimated project trip generation is presented in Table 2. Trip generation estimates for the proposed commercial building and logistics facility are based on daily and AM and PM peak hour trip generation rates obtained from the Institute of Transportation Engineers (ITE) Trip Generation Handbook, 11th Edition (ITE 2021). There are no industry standard rates for EV charging stations; therefore, trip rates for the EV charging station (by charging/fuel type) are based on assumptions regarding the maximum charging capacity, utilization rates, and other anticipated site operations. The assumptions are outlined in detail in the trip generation table notes.

Additionally, passenger car equivalent (PCE) factors were applied to the trip generation estimates to account for truck traffic. The San Bernardino County Congestion Management Program (CMP) indicates that projects with high truck percentages should convert project trips to PCE. A 1.5 PCE factor was applied to 2-axle trucks, 2.0 PCE for 3-axle trucks, and a 3.0 PCE factor was applied to 4-axle trucks, per the San Bernardino County CMP (San Bernardino Associated Governments 2016). As the ITE Trip Generation Handbook does not provide a breakdown of truck traffic by axle classification, vehicle mix data and percentages are also applied to the project trip generation estimates from the Southern California Air Quality Management District (SCAQMD) Warehouse Truck Trip Study Data Results and Usage (SCAQMD 2014).

As shown in Table 2, the project would generate 5,580 daily trips, 409 AM peak hour trips, and 447 PM peak hour trips. This is equivalent to 7,466 daily PCEs, 521 AM peak hour PCEs, and 569 PM peak hour PCEs.

Table 2. Project Trip Generation

PM Peak, equal split, assumes 7% of daily total occurs during PM peak	Based on ITE rates for truck stop			

INTENTIONALLY LEFT BLANK

4 Project Site Access

This section describes the proposed site access and roadway improvements, emergency access and pedestrian and bicycle access.

Site Access and Circulation

Access to the EV charging station would be via two full-access driveways along Lenwood Road, with the main driveway providing access to a four-lane internal road between the EV charging station and the logistics facility. Access to the logistics facility would be via six full access driveways along Lenwood Road, with access for both passenger cars and trucks, as shown in Figure 2. The driveways would vary in width from 30 feet to 50 feet. The project would provide a new 60-foot-wide roadway dedication providing future access to the property to the east of the site. Figure 9 presents the proposed 60-foot roadway section for the new public roadway proposed.

A Local Transportation Assessment was prepared for the project to analyze potential roadway and intersection traffic impacts with the project-added traffic. The Highway Capacity Manual (HCM) Synchro reports generated for the intersection level of service analyses provide preliminary queuing results for each of the project driveways. The reports show negligible queuing would occur at each of the driveways under all scenarios evaluated. Given the results of the HCM queuing reports, the proposed two-way left turn lane along the project frontage, and the low volume of through traffic on Lenwood Road, no off-site queuing issues are anticipated. As future development occurs along the west side of Lenwood Road, site access and potential off-site queuing should be evaluated as part of future development proposals.

Proposed Frontage Improvements

Lenwood Road is currently a two-lane north-south oriented roadway that is classified as a 104-foot wide Major Highway in the County's Circulation Master Plan. The project would improve the east side of Lenwood Road to its ultimate half-width along the project site's frontage including the construction of sidewalk, curb and gutter. This half section would contain a 10-foot shoulder, two 12-foot northbound travel lanes and half of a 12-foot center lane. The 10-foot shoulder would provide the dedicated right-of-way for implementation of a Class II bike lane as identified in the County's Circulation Master Plan (timing to be determined in consultation with the County). In addition, the project would add 6 feet of paving to the west half of Lenwood Road to accommodate the balance of the center striped median lane and would repave the existing southbound travel lane, to the extent such paving and re-paving have not already been completed by others. Further, the project would transition Lenwood Road back to existing width and provide striping north of the project boundary to Agate Road. See Figure 10, Proposed Lenwood Road Section, illustrating the proposed frontage improvements. These proposed improvements may be modified upon further review of the County Public Works and Land Use Services Departments. The right-of-way dedication for and construction of the ultimate width of the west side of Lenwood Road will be determined by future agreement between the City of Barstow and the County.

Emergency Access

All roadway, intersection and project access improvements would be overseen by the County and their qualified traffic engineers. This approach would ensure compliance with all applicable roadway design requirements. In the event of an emergency all the site access driveways would enable vehicles to enter/exit the project site. All street

improvements will be designed with adequate width, turning radius, and grade to facilitate access by County's firefighting apparatus, and to provide alternative emergency ingress and egress. The site plan would be subject to plan review by the County's Fire Department to ensure proper access for fire and emergency response is provided and required fire suppression features are included. Therefore, the project's impact due to inadequate emergency access would be less than significant. As such, no hazardous design features would be part of the project's roadway improvements or site access.

Pedestrian and Bicycle Access

The project site is primarily surrounded by vacant land with limited pedestrian or bicycle infrastructure provided. As described above, the project will construct sidewalk, curb and gutter along the project frontage, as well as provide the dedicated right-of-way for implementation of a Class II bike lane as identified in the County's Circulation Master Plan. As the adjacent areas surrounding the project site continue to develop, pedestrian and bicycle access will be improved.

Sidewalks are proposed throughout the project site providing pedestrian access to the various uses within the site, including the charging station, the commercial area, parking areas, and the logistics facility.

5 Vehicle Miles Traveled Analysis

On September 27, 2013, SB 743 was signed into law, which creates a process to change the way that transportation impacts are analyzed under California Environmental Quality Act (CEQA). SB 743 required the Governor's Office of Planning and Research (OPR) to amend the CEQA Guidelines to provide an alternative to level of service (LOS) for evaluating transportation impacts. Under the new transportation guidelines, LOS, or vehicle delay, is no longer considered an environmental impact under CEQA. OPR recommended vehicle miles traveled (VMT) as the most appropriate measure to evaluate a project's transportation impacts for land use projects and land use plans. The updates to the CEQA Guidelines required under SB 743 were approved on December 28, 2018.

In accordance with SB 743, the County of San Bernardino Transportation Impact Study Guidelines (San Bernardino County 2019) includes guidance and thresholds for conducting a VMT analyses for determining significant impacts under CEQA. A project-level VMT analysis has been completed for the project following the County's Guidelines. Detailed calculations and model outputs are included in Appendix A.

5.1 Project Screening

The County's Guidelines identifies projects that can be screened from conducting a project-specific VMT analysis based on the following screening criteria:

- Local Serving Project Screening
- Projects Generating Less than 110 Daily Vehicle Trips
- Transit Priority Area (TPA) Screening
- Low VMT Area Screening

A land use project need only meet one of the above screening thresholds to result in a less-than-significant impact.

Local Serving Project Screening

The County Guidelines suggest Local-Serving Retail under 50,000 SF and Local Essential Services such as K-12 schools, day care centers, and community institutions shortens nondiscretionary trips by putting those goods and services closer to residents, resulting in an overall reduction in VMT.

The project includes amenities that cater to both local residents and motorists traveling along Lenwood Road, I-15, and SR-58. It includes EV charging facilities that would primarily serve vehicles already using the adjacent roadways and freeways. This component, although not strictly local-serving in nature, does not generate additional trips that were not already occurring.

By offering dining, shopping, and EV charging opportunities, the project is expected to shorten vehicle trips for both local residents and passing motorists. This aligns with the County's objective to promote developments that contribute to reducing VMT. The retail component of the project is also less than 50,000 SF and therefore meets the Local Serving Retail screening criterion. Thus, the project's EV charging and retail (commercial) components qualify for an exemption from conducting a VMT assessment under the County Guidelines. Therefore, the Local Serving Project screening criteria is partially met for the EV charging station and commercial building.

Projects Generating Less Than 110 Daily Vehicle Trips

The County Guidelines state projects generating less than 110 daily vehicles trips are presumed to have a less-than-significant impact on VMT. As previously shown in Table 2, the project would generate 5,580 daily trips and therefore does not meet this screening criterion.

Transit Priority Area (TPA) Screening

The County Guidelines state that projects located within a TPA (i.e., within ½ mile of an existing "major transit stop" or an existing stop along a "high-quality transit corridor") may be presumed to have a less-than-significant impact absent substantial evidence to the contrary. Based on the Screening Tool results presented in Appendix A, the project site is not located within ½ mile of an existing major transit stop, or along a high-quality transit corridor. Therefore, the TPA screening criteria is not met.

Low VMT Area Screening

As noted in the County Guidelines, "development in efficient areas of the County will reduce VMT per person/employee and is beneficial to the region". The County Guidelines state that projects with VMT per person/employee lower than 4% below the existing VMT per person for the unincorporated County are considered to have a less-than-significant VMT impact.

It is general industry practice to perform a secondary evaluation to identify if a project is consistent with the existing land use within that traffic analysis zone or TAZ and use professional judgement that there is nothing unique about the project that would otherwise be mis-represented using data from the travel demand model.

Existing land use information was examined in the San Bernardino County Transportation Analysis Model (SBTAM) model for the project's TAZ 53962201 and was found to contain land use information that would be inconsistent with the project. Therefore, the project does not qualify for this screening criteria.

The project's EV charging station and commercial component was found to meet the Local Serving Project screening criteria. However, the remaining industrial component of the project does not meet eligible screening criteria. Therefore, a project-level VMT analysis has been prepared. Although the project's EV charging station and commercial component is not subject to further VMT analysis; these local serving land uses were conservatively included in the VMT analysis to ensure a full accounting of all project generated VMT.

5.2 VMT Approach

The County's Guidelines state that SBTAM is the preferred tool for conducting VMT analysis for land use projects in the County. San Bernardino County Transportation Authority's (SBCTA) most recent release of SBTAM is version is 3.2, released in June of 2024. SBTAM is a useful tool to estimate VMT as it considers interaction between different land uses based on socioeconomic data such as population, households, and employment. The calculation of VMT for land use projects is based on the total number of trips generated and the average trip length of each vehicle type.

For purposes of this assessment, VMT was estimated using the Production/Attraction method and Boundary method, as described below.

Production/Attraction Method

The Production/Attraction (PA) method for calculating VMT sums all weekday VMT generated by Home-Based Work (HBW) trips with at least one trip-end in the study area (i.e., Project Traffic Analysis Zone or TAZ) by trip purpose to/from their ultimate destination unless that destination is outside of the model boundary area. Productions are land use types that generate trips (residences), and attractions are land use types that attract trips (employment). The PA method allows Project VMT to be evaluated based on trip purpose, which is consistent with both the Office of Planning and Research (OPR) Technical Advisory and County Guidelines.

Boundary VMT Method

The boundary method is the sum of all weekday VMT on the roadway network within a designated boundary (i.e., County boundary or other designated geographic area). For this analysis, the boundary includes the unincorporated area of the County. The boundary method estimates VMT by multiplying vehicle trips on each roadway segment within the boundary by that segment's length. This is the only VMT method that captures the effect of cutthrough and/or displaced traffic. This approach consists of all trips, including those trips that do not begin or end in the designated boundary. In addition, since the Project is bordered by the City of Barstow, a 10-mile radius surrounding the Project has also been utilized to provide a more accurate and complete accounting of trips coming to and from the Project.

5.3 Impact Thresholds

As stated in the County Guidelines, the appropriate VMT metric for employment projects is VMT per employee. An employment project would result in a significant project-generated VMT impact if the following condition is met:

- Project-generated VMT per employee is greater than 4% below the existing VMT per employee for the unincorporated County.

Additionally, if the project is inconsistent with the regional transportation plan or sustainable community strategies (RTP/SCS) the project's cumulative effect on VMT would be considered significant if it results in the following condition:

- Cumulative year VMT per service population (population + employment) increases in the "with project" condition as compared to the no project condition.

The project proposes a General Plan amendment and re-zone. Therefore, the project is determined to be inconsistent with the current RTP/SCS and a cumulative analysis was also performed.

5.4 Analysis

Table 3 summarizes the County baseline VMT and project-generated VMT (based on the PA method) and provides a comparison to the County's impact threshold. As shown in the table, the project is estimated to generate VMT per employee below the County's adopted impact threshold and would result in a less-than-significant VMT impact.

Table 3. Project VMT Summary

Metric	County of San Bernardino Baseline	Project VMT
Employment	905,822	1,244[1]
VMT	20,824,465	15,961
VMT per Employee	22.9	12.8
County VMT Threshold (4% below)	22.0	
Potentially Significant?	*No*	

Source: SBTAM Model Results; Appendix A;
Notes: VMT = vehicle miles traveled

1. The employment estimate is conservative and is based on the SCAG Employment Density Study, Table II-B (The Natelson Company, Inc., SCAG Employment Density Report, October 21, 2001). The number of employees may be lower and VMT would likely lower along with employment.

Table 4 presents boundary VMT and boundary VMT per service population estimates for the cumulative conditions. The boundary VMT per service population with the project is found to remain unchanged for the Countywide boundary evaluation and decreases slightly for the 10-mile boundary evaluation, but does not exceed the County's adopted threshold. Impacts would be less than significant.

Table 4. Cumulative Boundary VMT

	County of San Bernardino Boundary		10-Mile Boundary	
Metric	No Project	With Project	No Project	With Project
Service Population	3,769,986	3,771,230	65,178	66,422
Boundary VMT	94,940,109	95,006,263	2,403,846	2,414,533
VMT per Service Population	25.2	25.2	36.8	36.4
Change in VMT per Service Population	0.0	—	-0.4	—

Source: SBTAM Model Results; Appendix A.
Note: VMT = vehicle miles traveled

6 Summary

Based on the results of the site access and VMT analysis presented in this TIS, the following summarizes the key findings of the analysis:

Project Trips

- The proposed project would generate 5,580 daily trips, 409 AM peak hour trips, and 447 PM peak hour trips. Accounting for truck traffic from warehousing and industrial land uses, the proposed project would generate to 7,466 daily PCEs, 521 AM peak hour PCEs, and 569 PM peak hour PCEs.

Pedestrian and Bicycle Facilities

- The project would include improvements along Lenwood Road, including frontage landscaping, pedestrian improvements, and bicycle improvements, as outlined in the San Bernardino County's Transportation and Mobility Element and the City's Circulation Element of the General Plan. Figure 10 presents the proposed cross section along these roads. All roadway improvements required as part of the project, whether located on or off site, would be designed and constructed in accordance with all applicable local, state, and federal roadway standards and practices. As the project continues through design review, detailed roadway improvements would continue to be developed in coordination with the county and city.

VMT Analysis

- The Project is estimated to generate VMT per employee below the County's adopted impact threshold and would result in a less-than-significant VMT impact.
- Additionally, the boundary VMT per service population in the with project scenario was found to remain unchanged for the Countywide boundary evaluation and decrease slightly for the 10-mile boundary evaluation, and do not exceed the County's adopted threshold. Impacts would be less than significant.

EV Charging Truck Stop/Auto and Distribution Center Vehicle Miles Traveled Analysis

MEMORANDUM

URBAN | CROSSROADS

DATE: August 8, 2024
TO: Lisa Valdez, Dudek
FROM: Alex So, Urban Crossroads, Inc.
JOB NO: 15833-01 VMT

LENWOOD EV CHARGING STATION AND LOGISTICS FACILITY PROJECT VEHICLE MILES TRAVELED (VMT) ANALYSIS

Urban Crossroads, Inc. has completed the following Vehicle Miles Traveled (VMT) Analysis for the Lenwood EV Charging Station and Logistics Facility Project (**Project**) located on Lenwood Road between State Route (SR)-58 and Interstate (I)-15, approximately one mile west of SR-58 and four miles west of downtown Barstow in unincorporated County of San Bernardino (APNs 049-714-203, 049-714-204, 049-714-214, and 049-714-215).

PROJECT OVERVIEW

The Project site is undeveloped and surrounded by undeveloped lands with the exception of a single-family residential neighborhood, High Desert Estates, located adjacent to the southern Project boundary. The Project is proposing development on approximately 20 acres in the southern portion of the site with an electric vehicle charging hub for light duty/passenger vehicles and medium and heavy-duty trucks. The site will have a range of EV chargers to serve different charging needs (e.g., automobiles vs medium and heavy-duty trucks; slower chargers for overnight truck charging vs fast charging for trucks, etc.). The EV charging station will include a commercial building of up to 15,000 square feet (SF) that will contain ancillary uses (e.g., food, convenience services, amenities, etc.) for those using the station, as well as for local residents and nearby light industrial uses. The remaining site is proposed to include three warehouse buildings of 447,144 SF each, for a total of 1,341,432 SF of light industrial warehouse, logistic, and distribution facilities. A site plan for the Project is provided in Attachment A.

BACKGROUND

The California Environmental Quality Act (CEQA) requires all lead agencies to adopt VMT as the measure for identifying transportation impacts for land use projects. To comply with CEQA, the County of San Bernardino adopted analytical procedures, screening tools, and impact thresholds for VMT, which are documented in their adopted Transportation Impact Study Guidelines (**County Guidelines**) (1).

VMT SCREENING

Consistent with the screening thresholds identified in the County Guidelines, the San Bernardino County Transportation Authority (SBCTA) VMT Screening Tool (Screening Tool) was used to aid in the VMT screening process. The County Guidelines state that a project may have a less than significant impact and screen out of requiring a project-level VMT analysis if it meets at least one of the County's VMT screening criteria. The County's adopted VMT screening criteria are as follows:

- Local Serving Project Screening
- Projects Generating Less than 110 Daily Vehicle Trips
- Transit Priority Area (TPA) Screening
- Low VMT Area Screening

A land use project need only meet one of the above screening thresholds to result in a less than significant impact.

LOCAL SERVING PROJECT SCREENING

County Guidelines suggest Local-Serving Retail under 50,000 square feet and Local Essential Services such as K-12 schools, day care centers, and community institutions shortens non-discretionary trips by putting those goods and services closer to residents, resulting in an overall reduction in VMT.

The Project includes amenities that cater to both local residents and motorists traveling along Lenwood Road, I-15, and SR-58. It includes EV charging facilities that will primarily serve vehicles already using the adjacent freeways. This component, although not strictly local-serving in nature, does not generate additional trips that were not already occurring.

By offering dining, shopping, and EV charging opportunities, the Project is expected to shorten vehicle trips for both local residents and passing motorists. This aligns with the County's objective to promote developments that contribute to reducing VMT. Thus, the Project's EV charging and retail components qualify for exemption from a VMT assessment under the County Guidelines.

The Local Serving Project screening criteria is partially met for the EV charging and associated retail components.

PROJECTS GENERATING LESS THAN 110 DAILY VEHICLE TRIPS

County Guidelines state projects generating less than 110 daily vehicles trips are presumed to have a less than significant impact on VMT. The Project is forecast to generate 5,580 two-way trips per day above the 110 daily trip threshold (see Attachment B).

Projects Generating Less Than 110 Daily Vehicle Trips screening criteria is not met.

TRANSIT PRIORITY AREA (TPA) SCREENING

County Guidelines state that projects located within a TPA (i.e., within ½ mile of an existing "major transit stop"[1] or an existing stop along a "high-quality transit corridor"[2]) may be presumed to have a less than significant impact absent substantial evidence to the contrary. However, the presumption may not be appropriate if a project:

- Has a Floor Area Ratio (FAR) of less than 0.75;
- Includes more parking for use by residents, customers, or employees of the project than required by the jurisdiction (if the jurisdiction requires the project to supply parking);
- Is inconsistent with the applicable Sustainable Communities Strategy (as determined by the lead agency, with input from the Metropolitan Planning Organization); or
- Replaces affordable residential units with a smaller number of moderate- or high-income residential units.

Based on the Screening Tool results presented in Attachment C, the Project site is not located within ½ mile of an existing major transit stop, or along a high-quality transit corridor.

TPA screening criteria is not met.

LOW VMT AREA SCREENING

As noted in the County Guidelines, "development in efficient areas of the County will reduce VMT per person/employee and is beneficial to the region.[3]" County Guidelines state that projects with VMT per person/employee lower than 4% below the existing VMT per person for the unincorporated County are considered to have a less than significant VMT impact.

It is general industry practice to perform a secondary evaluation to identify if the project is consistent with the existing land use within that TAZ and use professional judgement that there is nothing unique about the project that would otherwise be mis-represented utilizing the data from the travel demand model.

Existing land use information was examined in the San Bernardino County Transportation Analysis Model (SBTAM) model for the Project's traffic analysis zone (TAZ) 53962201 and was found to contain land use information that would be inconsistent with the proposed Project. Therefore, the Project does not qualify for this screening criteria.

Low VMT Area screening criteria is not met.

The Project's EV charging and retail component was found to meet the Local Serving Project screening criteria. However, the remaining industrial component of the Project was not found to meet eligible screening criteria and consistent with the County Guidelines, a project-level VMT analysis has been prepared. Although the Project's EV charging and retail component is not

[1] Pub. Resources Code, § 21064.3 ("'Major transit stop' means a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods.").
[2] Pub. Resources Code, § 21155 ("For purposes of this section, a high-quality transit corridor means a corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours.").
[3] County Guidelines; Page 19

subject to further VMT analysis; these local serving land uses were conservatively included in the VMT analysis to ensure a full accounting of project generated VMT.

VMT ANALYSIS

TRAFFIC MODELING METHODOLOGY

County Guidelines state that SBTAM is the preferred tool for conducting VMT analysis for land use projects in the County of San Bernardino. San Bernardino County Transportation Authority's (SBCTA) most recent release of SBTAM is version is 3.2, released in June of 2024. SBTAM is a useful tool to estimate VMT as it considers interaction between different land uses based on socio-economic data such as population, households, and employment. The calculation of VMT for land use projects is based on the total number of trips generated and the average trip length of each vehicle type.

VMT ANALYSIS METHODOLOGY

For purposes of this assessment, VMT was estimated using the Production/Attraction method and Boundary method. For the Production/Attraction method, VMT is presented as Home-Based-Work (HBW) VMT per employee, while the Boundary method presents VMT as total VMT and total VMT per Service Population (VMT/SP).

PRODUCTION/ATTRACTION METHOD

The Production/Attraction (PA) method for calculating VMT sums all weekday VMT generated by HBW trips with at least one trip-end in the study area (i.e., Project Traffic Analysis Zone or TAZ) by trip purpose to/from their ultimate destination unless that destination is outside of the model boundary area. Productions are land use types that generate trips (residences), and attractions are land use types that attract trips (employment). The PA method allows Project VMT to be evaluated based on trip purpose, which is consistent with both the Office of Planning and Research (OPR) Technical Advisory and County Guidelines.

BOUNDARY VMT METHOD

The boundary method is the sum of all weekday VMT on the roadway network within a designated boundary (i.e., County boundary or other designated geographic area). The boundary method estimates VMT by multiplying vehicle trips on each roadway segment within the boundary by that segment's length. This is the only VMT method that captures the effect of cut-through and/or displaced traffic. This approach consists of all trips, including those trips that do not begin or end in the designated boundary. In addition, since the Project is bordered by the City of Barstow, a 10-mile radius surrounding the Project has also been utilized to provide a more accurate and complete accounting of trips coming to and from the Project.

VMT METRIC AND SIGNIFICANCE THRESHOLD

As stated in County Guidelines, the appropriate VMT metric for employment projects is VMT per employee[4]. An employment project would result in a significant project-generated VMT impact if the following condition is met:

- Project-generated VMT per employee is greater than 4% below the existing VMT per employee for the unincorporated County.

Additionally, if the Project is inconsistent with the regional transportation plan or sustainable community strategies (RTP/SCS) the project's cumulative effect on VMT would be considered significant if it results in the following condition:

- Cumulative year VMT per service population (population + employment) increases in the with project condition as compared to the no project condition.

It is our understanding that the Project proposes a general plan amendment and change of zone. Therefore, the Project is determined to not be consistent with the current RTP/SCS and a cumulative analysis will also be performed.

COUNTY OF SAN BERNARDINO VMT PER EMPLOYEE

The County of San Bernardino existing VMT per employee has been calculated using SBTAM. Table 1 presents the resulting County of San Bernardino existing VMT per employee of 22.9 and 4% below existing VMT per employee of 22.0.

TABLE 1: COUNTY OF SAN BERNARDINO BASELINE VMT PER EMPLOYEE

	County of San Bernardino
Employee	905,822
VMT	20,824,465
VMT per Employee	22.9
4% Below Existing	22.0

PROJECT VMT ESTIMATES

To estimate project-generated VMT, standard land use information such as building square footage must first be converted into a SBTAM-compatible dataset. The SBTAM model utilizes socio-economic data (SED) (e.g., employment) for the purposes of vehicle trip estimation. Table 2 summarizes the SED inputs used to represent the Project. Project SED data was then added into the Project TAZ to obtain Project-generated VMT.

[4] County Guidelines; Page 20

TABLE 2: EMPLOYMENT ESTIMATES

Land Use	Quantity (SF)	Employment Density Factor[1]	Employees
Warehouse	1,341,432	1 employee per 1,195 SF	1,123
Retail/Fast Food	15,000	1 employee per 124 SF	121
Total	**-**	**-**	**1,244**

[1] SCAG Employment Density Study; Table II-B

Project-generated VMT and a comparison to the County's impact threshold is presented in Table 3. The Project is estimated to generate VMT per employee below the County's adopted impact threshold.

TABLE 3: PROJECT VMT PER EMPLOYEE

	Baseline
Employment	1,244
VMT	15,961
VMT/Employee	12.8
County Threshold	22.0
Potentially Significant?	No

Table 4 presents boundary VMT and boundary VMT per service population estimates for cumulative conditions. The boundary VMT per service population in the with project scenario is found to remain unchanged for the Countywide boundary evaluation and decrease slightly for the 10-mile boundary evaluation, and do not exceed the County's adopted threshold.

TABLE 4: CUMULATIVE BOUNDARY VMT

	County Boundary		10-Mile Boundary	
Cumulative	No Project	With Project	No Project	With Project
Service Population[1]	3,769,986	3,771,230	65,178	66,422
Boundary VMT	94,940,109	95,006,263	2,403,846	2,414,533
VMT per Service Population	25.2	25.2	36.8	36.4
Change in VMT per Service Population	0.0		-0.4	

[1] Service population refers to population and employment

CONCLUSION

Based on the results of this analysis, the following findings are made:

- The Project was evaluated against screening criteria as outlined in the County Guidelines. The Project's EV charging and retail component were found to meet the Local Serving Project screening criteria. However, the industrial component was not found to meet screening criteria and a VMT analysis was performed.
- Project-generated VMT estimates were calculated from SBTAM and compared to the County's adopted impact threshold of 4% below existing Countywide VMT per employee.

Project-generated VMT per employee was found to be below the County's impact threshold.

- The Project's cumulative effect on VMT was found to be unchanged or below the County's adopted impact threshold of no net increase in VMT per service population for with project conditions.

1 Introduction

1.1 Purpose of Document

Senate Bill (SB) 610 was passed on January 1, 2002, amending the California Water Code (CWC) to require detailed analysis of water supply availability for certain types of development projects. The primary purpose of SB 610 is to improve the linkage between water and land use planning by ensuring greater communication between water providers and local planning agencies, as well as ensuring that land use decisions for certain large development projects are fully informed as to whether a sufficient water supply is available to meet project demands. SB 610 requires preparation of a Water Supply Assessment (WSA) for a project that is subject to the California Environmental Quality Act (CEQA) and meets certain requirements. SB 610 is codified in CWC Division 6, Part 2.10 (Sections 10910–10915).

The Lenwood EV Charging/Low Carbon Fuels Auto/Truck Stop and Distribution Center Project (Project) has been determined to be subject to CEQA by the County of San Bernardino (County) acting as lead agency. The Project satisfies the statutory definition of a "project" for the purpose of determining SB 610 applicability because it is considered an industrial development occupying more than 40 acres of land and has more than 650,000 square feet of floor area, per CWC Section 10912(a)(5). The lead agency will make an independent determination as to whether there is adequate water supply for the proposed Project, having considered the entire administrative record. In compliance with SB 610, this WSA examines the availability of the identified water supply under normal-year, single-dry-year, and multiple-dry-year conditions over a 20-year projection, accounting for the projected water demand of the Project plus other existing and planned future uses of the identified water supply.

1.2 Project Location and Description

The proposed Project is located on Lenwood Road between CA 58 and I-15, in the census-designated place of Lenwood, San Bernardino County, California. The Project falls within Section 8 of Township 9 North, and Range 2 West of the Barstow, California USGS 7.5-minute Quadrangle and encompasses APNs 049-714-203, 049-714-204, 049-714-214, and 049-714-215 (Figure 1).

The Project proponent proposes to develop the approximately 100-acre Project area into (1) an EV charging/low carbon fuels hub to serve light duty/passenger vehicles and medium and heavy-duty trucks, and (2) a state-of-the-art concrete tilt-up light industrial, warehouse/distribution facility of 1,341,432 square feet in three buildings. The proposed Project site zoning designation is "IC – Community Industrial."

The proposed Project would also contain associated site improvements, including landscaping, parking, required utility facilities and upgrades, a drainage basin, and a buffer (e.g., landscaping, wall) at the project's southern boundary. Access to and from the Project area would be via Lenwood Road. The preliminary site master plan is shown on Figure 2.

EV Charging/Low Carbon Fuels Hub

The proposed approximately 20-acre EV charging/low carbon fuels hub would provide EV charging for light duty/passenger vehicles and medium and heavy-duty trucks and would also make available low carbon alternative

fuels - renewable diesel, renewable compressed natural gas (R-CNG), and hydrogen - all of which are included in and financially supported by the California Air Resources Board's Low Carbon Fuel Standard (LCFS) program.

The proposed EV charging hub is anticipated to have up to 20 mega-watt (MW) peak electrical power capacity. The site would provide a range of EV chargers to serve different charging needs (e.g., automobiles vs medium and heavy-duty trucks; slower chargers for overnight truck charging vs: MCS charging for trucks, etc.).

The EV charging/low carbon fuels hub would also include a commercial building of up to 15,000 square feet that would contain ancillary uses (e.g., food, convenience services, showers for travelers, other amenities, etc.) for those utilizing the hub, as well as for local residents and nearby light industrial uses.

Light Industrial Warehouse/Distribution

The remainder of the site, approximately 80-acres, would include a proposed warehouse/distribution facility to meet the demand for a highly functional, efficient logistics buildings that meet contemporary industry standards. The facility would consist of three buildings, each comprising 447,144 square feet, with a total square footage of 1,341,432.

1.3 Water Supply Assessment Applicability

SB 610 amended California Water Code (CWC) Sections 10910 and 10912 to create a direct relationship between water supply and land use. SB 610 establishes the legal framework for assessing the sufficiency of water supply for new development which qualify as a "Project". Per California Water Code Section 10912(a), a "Project" means any of the following:

- Proposed residential development of more than 500 dwelling units
- Proposed shopping center or business establishment employing more than 1,000 persons, or having more than 500,000 square-feet of floor space
- Proposed commercial office building employing more than 1,000 persons or having more than 250,000 square-feet of floor space
- Proposed hotel or motel or both, having more than 500 rooms
- Proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square-feet of floor area
- Proposed mixed-use project that includes one or more of the above components
- Proposed project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit project. (Water Code Section 10912(a).)

The Project qualifies as a "Project" per California Water Code Section 10912(a) because it is a proposed industrial facility that occupies more than 40 acres of land and has more than 650,000 square-feet of floor space. A WSA has also been prepared to assist in responding to the CEQA Guidelines Utilities and Service System impact questions. The CWC, as amended by SB 610, requires that a WSA address the following questions:

- Is there a public water system that will service the project?

- Is there a current Urban Water Management Plan] (UWMP) that accounts for the project demand?
- Is groundwater a component of the supplies for the project?
- Are there sufficient supplies to serve the project over the next 20 years?

The primary question to be answered in a WSA per the requirements of SB 610 is: *Will the total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection meet the projected water demand of the proposed project, in addition to existing and planned future uses of the identified water supplies, including agricultural and manufacturing uses?*

The response to this question also informs and assists the lead agency in responding to the CEQA Guidelines Utilities and Service Systems question: *Would the Project have sufficient water supplies available to serve the Project and reasonably foreseeable future development during normal, dry, and multiple dry years?*

1.3.1 Identification of a Public Water System

Section 10912 of the CWC defines a "public water system" as a system that has 3,000 or more service connections and provides piped water to the public for human consumption. Under SB 610, WSA reports must be prepared and furnished to local governments by the water utility serving that community for inclusion in any environmental documentation for projects meeting the specified requirements under Section 10912 (a) of the CWC and subject to CEQA. According to CWC Section 10910 (g)(1), "[…] the governing body of each public water system, or the city or county if either is required to comply with this act […] shall approve the assessment prepared pursuant to this section at a regular or special meeting." According to SB 610, the public water system serving the project area is required to prepare the WSA report.

The Project is within the Barstow service area of the Golden State Water Company and the Mojave Water Agency (DWR 2023a). Golden State Water Company (referred to herein as GSWC) is an investor-owned public utility company that supplies water to more than one million people in over 80 communities throughout California. The GSWC – Barstow area (referred to herein as GSWCB) currently serves 8,800 customers in Barstow and has been the community's water service provider since 1929 (GSWC 2021). GSWCB meets the definition of a Public Water System.

1.3.2 Urban Water Management Plan Coverage

Urban Water Management Plans (UWMPs) are prepared by California's urban water suppliers to support long-term resource planning and ensure adequate water supplies. UWMPs must be updated and submitted to the California Department of Water Resources (DWR) every 5 years for review and approval. The DWR has identified the UWMP as a foundational document in the preparation of a WSA, noting that a thorough UWMP can provide the required information to fulfill the standards set forth by SB 610. Every urban water supplier that either delivers more than 3,000 acre-feet per year (AFY) of water annually or serves more than 3,000 connections is required to assess the reliability of its water sources over a 20-year period under normal-year, dry-year, and multiple dry-year scenarios; these are the same requirements of a WSA, as specified by SB 610. A WSA may also rely on additional water supply data beyond the information in the UWMP.

An UWMP was created and submitted to DWR to satisfy 2020 requirements by GSWCB. The 2020 UWMP for GSWCB contains detailed information about the urban water supplier's water supply and demand estimates. The 2020 UWMP is an update to the GSWCB's 2015 UWMP and presents new data and analysis as required by DWR and the California Water Code since 2015 (GSWC 2021). The 2020 UWMP is a comprehensive water planning document that describes existing and future supply reliability, forecasts future water uses, presents demand management progress, and identifies local and regional efforts to meet projected water use. The water demand for the Project is not accounted for in the 2020 UWMP for GSWCB.

The UWMP projects future industrial water use in 5-year increments based on the projected number of customer connections for each land use category connections and the average unit demand factors for each land use category between 2016 and 2020 (GSWC 2020). The UWMP reported that the unit demand factor for industrial land uses between 2016 and 2020 was 10.22 acre-feet per connection. Based on the projected number of connections, industrial land use is projected to increase from 98 acre-feet per year (AFY) in 2025 to 105 AFY in 2045.

1.3.3 Groundwater as a Component of Project Water Supply

GSWCB has historically relied upon groundwater supplies as its primary source of supply to meet demands. GSWCB pumps groundwater from the Upper Mojave River Valley subbasin that is part of the groundwater basins covering the broader Mojave region. More specifically, GSWCB pumps groundwater from the Centro Subarea (Figure 3) which is a subarea of the Mojave Basin Area as defined in the Mojave Basin Adjudication. GSWBC has also incorporated water supplies derived from MVA's water management activities as part of its groundwater development and use actions (GWSCB 2021).

1.3.4 Sufficiency of Supplies Over the Next 20 Years

As described in Section 2, Project Water Demand; Section 4, Water Resources Inventory; and Section 5, Reliability of Water Supplies, there is adequate water available to supply the Project. Although the Project would increase the existing GSWCB water demand, GSWCB projects to have sufficient water supplies under normal-year, single-dry-year, and multiple-dry-year conditions over a 20-year projection.

INTENTIONALLY LEFT BLANK

2 Project Water Demand

Construction of the Project is anticipated to commence in 2025 (if the Project is approved). Construction activities would include site clearing and grading, trenching for utilities, building construction, paving, and landscaping. Construction water demand was not provided and is estimated to be insignificant. During construction, it is unknown how water will be delivered to the Project.

During operation, water would be supplied to the Project through a water main. The estimated water demand during the life of the Project includes irrigation demand, and demands are summarized in Table 1. Due to the unknown plans and water demands of future tenants, water demand was estimated using a variety of sources. The warehouse/distribution facility, totaling 1,341,432 SF, was estimated to have a water demand of 3.4 gallons/SF per year (US EIA 2023). The truck wash station was estimated to have a water demand of 480,000 gallons per year, assuming each wash uses 20 gallons and there are 2,000 washes per month (B. Vail, personal communication, September 20, 2023). The commercial building of 15,000 SF was estimated to use 304 gallons/SF per year (CalEEMod 2023).

The irrigation use demands were calculated using DWR's Model Water Efficient Landscape Ordinance worksheet (DWR 2023b) and assumed that the landscaped area of the Project sites would be low water use plantings requiring drip irrigation. The irrigation calculations are included as Appendix A and are summarized in Table 1 along with the operational demands.

Table 1. Water Usage Estimate

Project Component	Size (SF)	Gallons per SF/year	Gallons per year	Acre feet per year
Warehouse/Distribution Facilities	1,341,432	3.4	4,560,869	14
Commercial Building	15,000	304	4,553,010	14
Truck Wash	N/A	N/A	480,000	1.5
Landscaped Areas	627,041	15	9,565,573	29.4
			Total	58.9

Source: B. Vail, pers. comm., September 20, 2023, CalEEMod, US EIA 2023; DWR 2023
Notes: sf=square foot; 1 acre-foot = 325,851 gallons.

The total estimated Project operation and irrigation water usage demands can be rounded up to 59 AFY.

3 Water Resources Plans and Programs

The following provides a description of water resources plans and programs applicable to the Project.

3.1 Sustainable Groundwater Management Act

The Sustainable Groundwater Management Act (SGMA) is a package of three bills (Assembly Bill 1739, SB 1168, and SB 1319) and provides local agencies with a framework for managing groundwater basins in a sustainable manner. The SGMA establishes minimum standards for sustainable groundwater management, roles and responsibilities for local agencies that manage groundwater resources, priorities, and timelines to achieve sustainable groundwater management within 20 years of adoption of a Groundwater Sustainability Plan (GSP). The SGMA also requires all high and medium priority basins be sustainably managed. The Lower Mojave River Valley Basin and the Middle Mojave River Valley basin are very low priority[2] basins in DWR's 2019 SGMA Basin Prioritization and thus are exempt from the requirements of developing a Groundwater Sustainability Plan (DWR, 2019). The Project site is within the Mojave Basin – Centro Subarea, which is an adjudicated area and is managed by a court-appointed water master, as discussed below in Section 3.2.

3.2 Mojave Basin Area Adjudication

The Mojave Watershed was adjudicated in 1996 in an effort to preserve the limited resources typical of arid regions by regulating groundwater allocations. The adjudication was initiated by a 1990 lawsuit filed by the City of Barstow and Southern California Water Company, claiming excessive water use in the Upper Mojave River Basin, thus reducing the amount of surface and groundwater available to the central Basin. Additional cross-complaints were filed, and several parties joined the lawsuit. For more than 18 months, water producers of all types who were reliant upon the Mojave River Basin commenced negotiations which eventually produced the "Final Judgment" on how the groundwater supply could be fairly distributed (Water Education Foundation, 2022).

Mojave Water Agency is the current Court-appointed Watermaster for the Mojave Basin Area Judgment. The Watermaster's main responsibilities are to monitor and verify water production, collect required assessments, conduct studies, and prepare an annual report. The adjudication is primarily concerned with maintaining groundwater levels to help maintain a specified level of groundwater pumping in the area (Mojave Water Agency, 2022). The Watermaster does not have a specific obligation towards maintaining water quality; however, it is noted that continued pumping in depleted areas may result in long-term local negative water quality impacts such as migration of lesser quality water. The Watermaster is currently responsible for reporting the following types of data in the Mojave Basin Area:

- Verification of reported groundwater production
- Mojave River flows
- Precipitation Page 6-4 Salt and Nutrient Management Plan, Mojave Water Agency
- Wastewater discharges

[2] Under the 2019 Basin Prioritization, all adjudicated basins were automatically assigned a very low priority because they are excluded from SGMA. A "very low" priority in this case does not suggest that a basin does not have problems with respect to groundwater.

- Subsurface inflow
- State Water Project and wastewater imports
- Groundwater levels
- Ungauged surface water inflows

3.3 Urban Water Management Planning Act

The Urban Water Management Planning Act (CWC Sections 10610–10657) requires urban water suppliers to prepare a UWMP every 5 years and to submit it to the DWR, the California State Library, and any city or county within which the supplier provides water supplies. All urban water suppliers, either publicly or privately owned, providing water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 acre-feet (AF) annually are required to prepare a UWMP (CWC Section 10617).

The Urban Water Management Planning Act was enacted in 1983. Over the years, it has been amended in response to water resource challenges and planning imperatives confronting California. A significant amendment was made in 2009 as a result of the governor's call for a statewide 20% reduction in urban water use by 2020, referred to as "20x2020," the Water Conservation Act of 2009, and "SB X7-7." This amendment required urban retail water suppliers to establish water use targets for 2015 and 2020 that would result in statewide water savings of 20% by 2020. Beginning in 2016, urban retail water suppliers were required to comply with the water conservation requirements in SB X7-7 in order to be eligible for state water grants or loans.

A subsequent substantial revision to the Urban Water Management Planning Act was made in 2018 through a pair of bills (Assembly Bill 1668 and SB 606), described below in Section 3.4, Water Use Efficiency Standards. These changes include, among other things, additional requirements for Water Shortage Contingency Plans, expansion of dry-year supply reliability assessments to a 5-year drought period, establishment of annual drought risk assessment procedures and reporting, and new conservation targets referred to as "annual water use objectives," which will require retailers to continue to reduce water use beyond the 2020 SB X7-7 targets. The Urban Water Management Planning Act contains numerous additional requirements that a UWMP must satisfy.

3.4 Water Use Efficiency Standards

The Water Conservation legislation of 2018 (SB 606 and Assembly Bill 1668)— referred to as "Making Water Conservation a California Way of Life" or the "2018 Water Conservation Legislation"— established a new foundation for long-term improvements in urban water supplier conservation and drought planning to adapt to climate change and the longer, more intense droughts in California. Together, Assembly Bill 1668 and SB 606 lay out a new long-term water conservation framework for California. This new framework is far-reaching for both the urban and agricultural sectors of California and represents a major shift in focus. Programs and initiatives are organized around four primary goals:

1. Use water more wisely
2. Eliminate water waste
3. Strengthen local drought resilience
4. Improve agricultural water use efficiency and drought planning

Collectively, this legislation provides a road map for all Californians to work together to ensure that we will have enough water now and, in the years, ahead. One of the major outcomes of the legislation is the adoption of long-term standards for the efficient use of water and performance measures for commercial, industrial, and institutional water use on or before June 30, 2022. The bill establishes a standard for indoor water use of 55 gallons per capita daily to be reached by 2025, 52.5 gallons per capita daily beginning in 2025, decreasing to 50 gallons per capita daily beginning in 2030, or an alternative to this standard as determined jointly by DWR and State Water Resources Control Board in accordance with necessary studies and investigations.

On July 8, 2021, the Governor signed Executive Order N-10-21 which asks Californians to voluntarily reduce water use by 15% from 2020 levels. The Executive Order was in direct response to California experiencing the second driest year on record and the ongoing drought.

On January 4, 2022, the State Water Resources Control Board adopted an emergency regulation that prohibits certain wasteful water use practices statewide and encourages Californians to monitor their water use more closely while building habits to use water wisely.

3.5 Water Shortage Contingency Plan

GSWCB includes a water shortage contingency plan within their UWMP that presents how the water supplier will respond in the event of an actual water shortage contingency. Beginning in July 2022, GSWCB is required to submit an Annual Water Supply and Demand Assessment examining the GSWCB service area's anticipated water reliability for the current year and one additional dry year to determine what, if any, water shortages stages may be triggered during the required period. The Annual Assessment will be used by GSWCB decision-makers to prepare for and initiate implementation of any needed response actions, as well as inform customers, the general public, interested parties, and local, regional, and state governments entities to prepare for such required actions, if necessary (GSWCB 2021).

4 Water Resources Inventory

The following provides a description of the potential water sources available to the Project.

4.1 Local Surface Water

Golden State Water Company does not currently use surface water to meet its water demands (GSWC 2021). The nearest major river to the Project site is the Mojave River, which is approximately 1-mile north of the Project site (Figure 3).

4.2 Groundwater

Groundwater is the primary water supply source for GSWCB. GSWCB pumps groundwater from the Upper Mojave River Valley Basin, and more specifically, from the Centro Subarea which is a subarea of the Mojave Basin Area as defined in the Mojave Basin adjudication (GSWC 2021). The Project overlies two basins designated by DWR (Figure 3), the Lower Mojave River Valley Basin (LMRV Basin; 6-040) and the Middle Mojave River Valley Basin (MMRVB; 6-041). The Project overlies the Centro subarea of the Mojave Basin Area. The Mojave Basin Area is subdivided into five smaller areas (Oeste, Alto, Este, Centro, and Baja) and the Project would be located within the Centro Subarea (Figure 3). The Project lies within the Mojave River Groundwater Basin as defined by USGS (USGS 2023), which is commonly referred to as the Mojave Basin Area.

4.2.1 Lower Mojave River Valley Basin

The Project site is located within the LMRV Basin as mapped by the DWR and is exempt from the requirements of developing a Groundwater Sustainability Plan (GSP) as it is designated as a very-low priority basin in an adjudicated area.

4.2.1.1 Hydrogeologic Setting

The LMRV Basin is bounded on the north from the contact between Quaternary sedimentary deposits and the Tertiary rocks aged Waterman and Calico Mountains. The southern boundary is the contact between the unconsolidated sediments and the consolidated basement rocks of Daggett Ridge, the Newberry Mountains, and the Rodman Mountains. The LMRV Basin is bounded to the southeast by the Pisgah fault and to the west by the Camp Rock-Harper Lake fault zone. The northeastern LMRV Basin boundary is arbitrary divide between the Coyote Lake Vally Basin and Caves Canyon Basin (DWR, 2004).

4.2.1.2 Groundwater Supply Description

Golden State Water Company has historically pumped groundwater directly from the Mojave Basin Area to meet water demands within its service area. Groundwater movement occurs between each of the subareas of the Mojave Basin Area with the primary form of recharge being predominantly from infiltration from the Mojave River (Golden State Water Company, 2021). The Mojave Basin Area Watermaster monitors groundwater levels in two separate areas within the Centro subarea: (1) the Harper Lake Area located generally northwest of the Mojave River and (2) Hodge

and Lenwood Road located along the Mojave River. The Project is in the southeastern portion of the Centro Subarea, approximately 1 mile south of the Mojave River (Figure 3).

The Mojave Basin Area Watermaster (2023) notes that water levels in Centro subarea have shown general stability with seasonal variability, with recovery occurring during wet years and declines during dry years. Water levels in the Centro subarea in wells located near the Mojave River exhibit limited recharge over the past ten years due to increased pumping. Water levels in wells located in the Harper Lake Area have shown slow recovery due to slowed pumping. Limited recharge has been observed within the water levels observed near the Mojave River over the past 10 years due to pumping.

Water supply conditions for the past 10 years have been dry. During the 2021-2022 Water Year the precipitation at Lake arrowhead amounted to 46.64 inches, which is about 112 percent of the 60-year Base Period average of 41.5 inches. The Mojave Basin Area Watermaster has determined that continuation of dry conditions from below normal precipitation will result in further water level declines (Mojave Basin Area Watermaster, 2023).

According to the Sustainable Groundwater Management Act (SGMA) Basin Prioritization Dashboard, DWR has designated the LMRV Basin as very low priority, and the Basin has been adjudicated to determine the water rights of the various producers (DWR, 2023). Because the Project is within an adjudicated area, it is not subject to the requirements of California's SGMA, but instead is subject to groundwater pumping allocations under the court adjudication set up to mitigate long-term overdraft, to keep subareas in balance, and to meet biological resource mitigation obligations (Mojave Basin Area Watermaster 2023). Final Judgment was entered in 1996 adopting the physical solution set forth in the Judgment. The purpose of the Judgment was to create incentives to conserve local water, guarantee that downstream producers will not be adversely affected by upstream producers, and assess producers to obtain funding for the purchase of imported water. To carry out the Mojave Basin Judgment and sustainability manage and mitigate the observed water level declines, the Mojave Water Agency has assigned Base Annual Production amounts to each producer using 10-acre feet per year or more.

4.2.1.3 Groundwater Quality

Raw water is not utilized currently within the GSWC Barstow System. The Golden State Water Company Barstow well system utilizes sodium hypochlorite injected at the wellheads as a disinfectant for water entering the distribution for supplied potable water (GSWC 2021). Thus, this system is considered a potable water system.

Within the LMRV Basin, sodium bicarbonate character groundwater is primarily present. Sodium-calcium sulfate character is observed in the Daggett and Newberry springs. Sodium chloride, sodium-calcium chloride, and sodium chloride-sulfate occur east of Troy Lake. Fluoride concentrations are elevated around Newberry Springs, with elevated boron and fluoride concentrations near Camp Cady. Numerous leaking underground storage tank sites are in the Barstow area, introducing various contaminants to groundwater such as benzene, toluene, ethylbenzene, xylene, and methyl-tertiary-butyl-ether. A superfund site is present in the area adjacent to Barstow at the Nebo and Yermo Marine Corps; the site has impacted groundwater with trichloroethane (DWR, 2004).

4.2.2 Middle Mojave River Valley Basin

The Project site is located within the MMRV Basin as mapped by the DWR and is exempt from the requirements of developing a GSP as it is designated as a very-low priority basin in an adjudicated area.

4.2.2.1 Hydrogeologic Setting

The MMRV Basin is bounded on the north from both surface and subsurface divides, including the Helendale fault, a contact between Quaternary alluvium and the Kramer Hill and Iron Mountain basement rocks. The southern boundary is marked by an approximate east-west line from the Helendale Basement rock to the Shadow Mountains. The Camp Rock-Harper Lake fault Zone bounds the basin to the east, and to the west the boundary is marked by surficial drainage divide and the outcrops of the basement rock of the Shadow Mountains. (DWR, 2003; Figure 4).

4.2.2.2 Groundwater Supply Description

Groundwater Supply for the Project area is discussed above in section 4.2.1.2.

According to the Sustainable Groundwater Management Act (SGMA) Basin Prioritization Dashboard, DWR has designated the MMRV Basin as very low priority and the Basin has been adjudicated to determine the water rights of the various producers (DWR, 2023). Because the Project is within an adjudicated area, it is not subject to the requirements of California's SGMA, but instead is subject to groundwater pumping allocations under the court adjudication set up to mitigate long-term overdraft, to keep subareas in balance, and to meet biological resource mitigation obligations (Mojave Basin Area Watermaster 2023). Final Judgment was entered in 1996 adopting the physical solution set forth in the Judgment. The purpose of the Judgment was to create incentives to conserve local water, guarantee that downstream producers will not be adversely affected by upstream producers, and assess producers to obtain funding for the purchase of imported water. To carry out the Mojave Basin Judgment and sustainability manage and mitigate the observed water level declines, the Mojave Water Agency has assigned Base Annual Production amounts to each producer using 10-acre feet per year or more.

4.2.2.4 Groundwater Quality

Within the MMRV Basin, sodium bicarbonate character groundwater is present near the Mojave River channel. Sodium sulfate-chloride is present near Helendale, sodium calcium sulfate is present near Lenwood, and sodium chloride-sulfate groundwater is present east of the Shadow Mountains. The Lenwood Landfill has leached volatile organic compounds, salts and nitrates to local groundwater within the lower portion of the basin. Effluent irrigation from the Barstow Wastewater reclamation facility could also have an impact on groundwater quality, although naturally occurring nitrates and salts are present within the basin (DWR, 2004).

4.2.3 On-Site Well Inventory and Groundwater Levels

Figure 5 shows wells in the vicinity of the Project site according to the National Water Information System Mapper (USGS 2022), SGMA Data Viewer (DWR 2023), and Groundwater Ambient Monitoring and Assessment Program (SWRCB 2023). According to the SGMA Data Viewer, there are numerous groundwater wells surrounding the Project site and two wells on the Project site. The two wells shown on the northern boundary of the Project site are USGS wells (Site Numbers 345327117065301 and 345327117065401) and are categorized as inactive (USGS 2023).

The closest well to the Project site within the Lower Mojave River Valley Basin that has had regular (yearly or twice-yearly) monitoring of groundwater levels is 0.25 miles north of the Project site (Site Number 345339117065001). This well indicates that groundwater levels north of the Project area have shown an overall decline between 1987 and 2023, ranging between a high of 2,145 feet above mean sea level (amsl) in 1995 to a low of 2,093 feet amsl

in 2022 (Figure 6). Another well approximately 5 miles southwest of the Project site shows that although the most recent data point in May 2023 is the highest water level measurement since 2010 (2,113 feet amsl), the groundwater level had been steadily trending downward since 2010 (Figure 7).

4.3 Imported Water and Wastewater/Recycled Water

GSWC does currently have any imported water connection infrastructure, however imported supplies from the Mojave Water Agency are used for local groundwater recharge. GSWCB does have to pay a replacement water fee to the Mojave Basin Area Watermaster for any supply it uses in excess of its pumping limits. Base annual production limits are discussed in detail in Section 5. The Watermaster also manages the transfer of surplus water between producers in the Basin. Surplus and deficits between the producers are calculated annually.

GSWCB is developing recycled water supplies for potential future use but had not perfected its use as of 2020 (GWSCB 2021).

INTENTIONALLY LEFT BLANK

5 Reliability of Water Supplies

The Mojave Basin Judgment assigned the Base Annual Production (BAP) rights to each producer using 10 AF or more, based on historical production from 1986 to 1990. Parties to the Judgment are assigned a variable Free Production Allowance (FPA), which is a percentage of the BAP set annually by the Court for each subarea based on the recommendation of the Watermaster. The BAP is reduced or "ramped-down" over time until FPA comes within 5 percent of the Production Safe Yield (PSY) as defined by the Judgment. The FPA for the Centro Subarea was 70 percent of the BAP for water year 2020-2021. GSWCB derives its water supply from the Centro subarea. GSWCB's BAP is 14,407 AFY[1]. Any producer that pumps more than their FPA must purchase Replenishment Water from the Watermaster equal to the amount of production in excess of their total available FPA or transfer unused FPA from another party within their subarea (GSWC 2021).

The Centro Subarea remains in an overdraft condition and GSWCB anticipates that its FPA will continue to ramp down by 5% per year over the next five years. Table 2 shows the projected Mojave Adjudication FPA for GSWCB through 2025 for a normal year, a single dry year, and a multi-year drought. A "normal year" is represented by a year with normal hydrologic conditions. A "single dry year" and "multi-year drought" is defined as a condition that may require reduced water deliveries to customers caused by regulatory decrees. GSWCB assumes that because of the extremely arid conditions in the Mojave Desert even in wet years, the hydrology does not exert a strong influence on outdoor water use (GSWC 2021).

Table 2. Projected Mojave Adjudication FPA for GSWCB through 2025 (AFY)

Year		FPA	FPA Percent
Normal		10,085	70
Single Dry Year		10,085	70
Multi-Year Drought	2021 (Year 1)	10,085	70
	2022 (Year 2)	9,365	65
	2023 (Year 3)	8,644	60
	2024 (Year 4)	7,924	55
	2025 (Year 5)	7,204	50

Source: GSWCB, 2021.
Notes: FPA = Free Production Allowance

Although the PSY of the Mojave Basin appears to be declining in the Centro Subarea, the FPA is predicted to stabilize after 2025. Table 3 shows the GSWCB's projected FPA in a Normal Year, Single Dry Year, and Five Consecutive Dry Years from 2025 through 2045 at 50% (GSWC 2021).

Table 3. Projected Mojave Adjudication FPA for GSWCB through 2045 (AFY)

FPA at 50%	2025	2030	2040	2045
Normal	7,204	7,204	7,204	7,204

Notes: FPA = Free Production Allowance

GSWCB has taken actions to protect its water supplies against hydrological and regulatory variability by storing water assets for future use through carryover provision of the Mojave Basin Adjudication. GSWCB's 2020-2021 carryover supply total was 11,526 AF, and it will continue to have carryover water supplies through 2045 (Table 4).

Table 4. Projected Carryover Water Supplies Through 2045 (AFY)

FPA at 50%		2025	2030	2040	2045
Normal		7,924	7,204	7,204	7,204

Notes: FPA = Free Production Allowance

The Project is in the census-designated place of Lenwood, San Bernardino County, California and is within the service area of GSWCB and therefore would receive water from GSWCB. Water demand and supply numbers for GSWCB without the Project are shown in Table 5 and Table 6, respectively (GSWCB 2021).

Table 5. Current and Projected Water Demand (without Project) for Normal Year

	Actual (AF)	Projected (AF)				
Water Sources	2020	2025	2030	2035	2040	2045
Demand

Notes: AF = acre-feet
"Normal year" is represented by a year with normal hydrologic conditions.
"Single dry year" and "Multi-Year Drought" is defined as a condition that may require reduced water deliveries to customers caused by regulatory decrees. GSWCB assumes that because of the extremely arid conditions in the Mojave Desert even in wet years, the hydrology does not exert a strong influence on outdoor water use.

The Project is expected to use 59 AFY of water, as explained in Section 2. Table 7 shows the GSWCB supply, demand, and surplus of water factoring in the Project water demand through 2045 for normal years, single dry years, and a multi-year drought. The demand is the total projected demand from Table 5, plus the estimated 59 AFY of the Project.

Table 7. Water Supply and Demand Comparison Through 2045 (with Project)

Total Supply		Projected (AF)				
		2025	2030	2035	2040	2045
Normal	Supply	15,128	14,408	14,408	14,408	14,408
	Demand	5,494	5,587	5,681	5,777	5,874
	Difference	9,634	8,821	8,727	8,631	8,534
Single Dry Year	Supply	15,128	14,408	14,408	14,408	14,408
	Demand	5,494	5,587	5,681	5,777	5,874

Table 7. Water Supply and Demand Comparison Through 2045 (with Project)

Total Supply			Projected (AF)

Source: GSWCB, 2021.
Notes: AF = acre-feet
"Normal year" is represented by a year with normal hydrologic conditions.
"Single dry year" and "Multi-Year Drought" is defined as a condition that may require reduced water deliveries to customers caused by regulatory decrees. GSWCB assumes that because of the extremely arid conditions in the Mojave Desert even in wet years, the hydrology does not exert a strong influence on outdoor water use.
"Demand" is discussed in Section 2.

6 Conclusion

Golden State Water Company–Barstow relies on water pumped from the Centro Subarea of the Mojave River Basin which has shown water levels with general stability with seasonal variability, recovering during wet years and declining during dry years. Due to increased pumping and unsustainable yields, the Mojave River Basin was Adjudicated in 1996 to control water levels and manage the future for the growing basin population. GSWCB has reliable supplies to meet its retail customer demands in normal, single dry years, and five consecutive dry year conditions through 2045 even with planned FPA reductions. Because GSWCB extracts only as much groundwater as is necessary to meet customer demands, it is anticipated that supplies and demands are congruent across all scenarios (GSWC 2021). Over the long term, GSWCB's water supply portfolio should be adequate to meet its potential long-term growth objectives.

While the GSWCB service area is expected to experience population growth over the next 25 years, the 2020 UWMP has also considered increased development as a result. Furthermore, GSWCB has submitted a plan to study recycled water use in the Mojave Water Agency Integrated Regional Water Management Plan. As seen in the tables presented in Section 5, GSWCB expects to meet projected demand estimates for normal, dry, and multiple dry water years. Given this information, the EVC Truck Stop Project water demand estimated to be 59 AFY would likely not adversely affect the water supply for GSWCB for the duration of the Project life.

1 Introduction

1.1 Purpose and Scope of the LTA

The purpose of this Local Transportation Assessment (LTA) is to identify potential transportation impacts associated with the proposed Lenwood EV Charging Station and Logistics Facility Project (project) to be located on Lenwood Road between California Highway 58 (CA 58) and Interstate 15 (I-15), in the County of San Bernardino (Figure 1, Project Location). This LTA has been prepared per the San Bernardino County Transportation Impact Study Guidelines (July 2019), the San Bernardino County Transportation Authority's (SBCTA) Congestion Management Program (CMP) and Caltrans Transportation Impact Study Guide (May 2020). In addition, this LTA complies with the City of Barstow Circulation Element (2015). The scope of the LTA was approved by the San Barnardino County Public Works Department and the City of Barstow in April 2025. The approved Transportation scoping memo is provided as Appendix A. The analysis is also based in part on the Barstow International Gateway (BIG) 2 Level of Service Assessment – Transportation Analysis (Kimley Horn 2025) published in November 2025.

The purpose of this LTA is to:

- Document existing roadway, pedestrian, bicycle, transit and traffic conditions, including intersection levels of service in the study area;
- Estimate trip generation, distribution, and assignment characteristics for the proposed project;
- Provide a Vehicle Miles Traveled (VMT) analysis per Senate Bill 743, the updated California Environmental Quality Act (CEQA) Guidelines, and the San Bernardino County Transportation Impact Study Guidelines;
- Document future short-range (Opening Year 2028) intersection levels of service in the study area per traffic volumes derived from adding growth to existing traffic volumes;
- Analyze the potential traffic impacts that would occur as a result of buildout of the proposed project under the Opening Year (2028) and Horizon Year (2048) buildout conditions;
- Identify CEQA-required mitigation measures for significant transportation impacts and/or other improvements needed to meet level of service standards (if any); and,
- Provide findings and recommendations based on the traffic analysis of the proposed project.

Figure 1, Project Location and Study Area, shows the project location and study area. The study area is comprised of 15 intersections, two roadway segments, and eight project driveways.

1.2 Project Description

The approximately 100-acre Project site includes four parcels (049-714-203, 049-714-204, 049-714-214, and 049-714-215) and is located on Lenwood Road between CA 58 and Interstate-15, approximately one mile west of CA 58 and four miles west of downtown Barstow. The Project site is undeveloped and surrounded by undeveloped lands with the exception of rural residential properties to the north and a single-family residential neighborhood, High Desert Estates, located adjacent to the southern Project boundary.

The project site plan is provided as Figure 2, and a summary of the proposed land uses is presented in Table 1. The Project is proposing development on approximately 20-acres in the southern portion of the site with an electric

vehicle (EV) charging hub for light duty/passenger vehicles and medium and heavy-duty trucks. The site will have a range of EV chargers to serve different charging needs (e.g., automobiles vs medium and heavy-duty trucks; slower chargers for overnight truck charging vs: fast charging for trucks, etc.). The EV charging station will include a commercial building of up to 15,000 square feet (SF) that will contain ancillary uses (e.g., food, convenience services, amenities for site users, etc.) for those using the station, as well as for local residents and nearby light industrial uses. The remaining site is proposed to include three warehouse buildings of 447,144 SF each, for a total of 1,341,432 SF of light industrial warehouse, logistic, and distribution facilities. Access would be provided from Lenwood Road via eight driveways, with a four-lane internal road provided between the EV charging station and the logistics facility. Section 8 provides further information about the proposed site access and frontage improvements.

Table 1. Summary of Proposed Project Components

	Land Use	Size
EV Charging Station	Truck Chargers	45 chargers
	Auto Chargers	8 chargers
	Truck Wash	6,000 SF; 2 lanes
	Truck Maintenance	4,000 SF; 4 bays
Commercial	Retail	12,000 SF
	Fast Food with Drive-thru	3,000 SF
Warehouse	Building A	447,144 SF
	Building B	447,144 SF
	Building C	447,144 SF
	Subtotal	*1,341,432 SF*

Notes: SF = square feet

2 Study Area

This section provides a summary of the existing street network, including the major roadways serving the site, the existing transit service, and bicycle and pedestrian facilities in the study area.

2.1 Existing Street Network

Figure 3 provides the County of San Bernardino Roadway Network and Figure 4a provides the City of Barstow General Plan Roadway Network. The City is in the process of updating their General Plan and associated circulation maps. A map of the City's proposed roadway network is provided as Figure 4b and a map of the City's proposed goods movement routes is provided as Figure 5 (City of Barstow 2025). Characteristics of the primary roadways within the study area are described below.

- I-15 is a north-south, divided, four to eight-lane freeway classified as a major interstate freeway that begins near the Mexico—US Border and extends to Alberta, Canada, and serves as a critical connection for many other regional roadways, freeways, and highways. Caltrans classifies I-15 as a designated truck route. The nearest interchange to the site is provided at I-15 and Lenwood Road, approximately 3.25 miles south of the site.
- State Route 58 is a four-lane east-west divided highway which currently has its eastern terminus at the I-15 freeway in south Barstow. SR-58 provides regional access westerly to Bakersfield and northern California cities. The nearest interchange to the site is provided at SR-58 and Lenwood Road, approximately 1.5 miles north of the site. SR-58 is a designated truck route in the City of Barstow Circulation Element.
- Community Boulevard is an east-west two-lane roadway between Hinkley Road to the west and Old Highway 58 to the east. Community Boulevard is designated as a Collector in the City of Barstow Circulation Element.
- Lenwood Road is a north-south two to four-lane road designated as a Major Highway in the County's Roadway Network and a Primary Arterial in the City of Barstow Circulation Element. Lenwood Road is proposed as an Industrial Arterial as part of the City's General Plan update (City of Barstow 2025). Lenwood Road serves the west end of Barstow; with an interchange at I-15, and intersects west Main Street in the unincorporated community of Lenwood. North of Main Street it crosses the Mojave River and the BNSF Railroad to link with SR-58. South of I-15, Lenwood Road was extended to the old Sidewinder Road interchange. This new roadway, named Outlet Center Drive, provides a secondary access to the Lenwood Road/I-15 Freeway interchange commercial area. Portions of Lenwood Road, near the I-15 interchange and commercial areas and near Main Street have been fully improved with sidewalks, curb and gutter, and widened to four lanes, with left turn pockets at major intersections.
- Agate Road is a two-lane local road between Lenwood Road to the west and Western Drive to the east. Agate Road serves the residential neighborhoods to the north and east of the project site.
- Jasper Road is a two-lane local road between Roadrunner Road to the west and Pettit Road to the east. East of Pettit Road, Jasper Road traverses north-south where it terminates at Agate Road to the north.
- Main Street (old U.S. Highway 66) is the key east-west arterial through the City of Barstow and is designated as a Major Highway in the County's Roadway Network and as a Primary Arterial in the City of Barstow Circulation Element. Main Street is also a designated truck route in the City of Barstow Circulation Element. It currently has interchanges with I-15 and I-40. West of Lenwood Road, the roadway becomes National Trails Highway and provides local access to the Helendale/Oro Grande areas. This roadway also serves as an alternative route for I-15 south to Victorville.

2.2 Transit System

The City of Barstow (and its sphere of influence) is served by bus services provided by the Victor Valley Transit Authority (VVTA), which provides regional and local services throughout Victor Valley. Regionally, the City is served by passenger rail services offered by the National Railroad Passenger Corporation (Amtrak). The rail and transit providers are described below.

Victor Valley Transit Authority

VVTA provides local bus service for the communities of Adelanto, Apple Valley, Barstow, Helendale, Hesperia, Victorville, and unincorporated areas of San Bernardino County. VVTA operates five local bus routes in Barstow, providing bus connections between City Hall, shopping centers, schools and colleges, and residential areas. Route 3 shown in Figure 6, Existing Transit Facilities, is the closest bus route to the project site, with bus stops near the corner of Lenwood Road and Camino Del Sol, approximately 315 feet south of the project site, and near the corner of Lenwood Road and Agate Road, approximately 675 feet north of the project site. The route operates weekdays, between 6:00 a.m. and 7:50 p.m., Saturday and Sunday between 8:00 a.m. and 4:50 p.m. (VVTA 2023).

VVTA also provides commuter service between Barstow and Fort Irwin and regional service between Barstow, Victorville and San Bernardino, and Barstow, Hinkley and Helendale.

VVTA also offers paratransit services for persons with special needs on any paved street within Barstow as long as it is within their service boundaries. The VVTA paratransit services do not travel a fixed route and provide a flexible alternative to the fixed bus routes (VVTA 2023).

Amtrak

Amtrak is a national rail operator, with 21,000 route miles in 46 states, the District of Columbia, and three Canadian Provinces. The closest passenger rail station is the Barstow Amtrak Station, located at 650 North First Avenue in Barstow, located approximately six miles east of the project site. The Barstow Amtrak Station is part of the Southwest Chief Route, an east-west rail line extending from Los Angeles, California, to Chicago, Illinois (Amtrak 2023).

2.3 Pedestrian and Bicycle Facilities

The project site is primarily surrounded by vacant land (except for residential to the north and south) with limited pedestrian or bicycle infrastructure provided. Where new development has occurred, sidewalks typically have been constructed along project site frontages and within residential developments. A sidewalk is provided on the west side of Lenwood Road, along the frontage of the Valmont Utility company, immediately south of the project site. As the adjacent areas surrounding the project site continue to develop, pedestrian access will be improved.

Figure 7 presents the County's Bicycle and Pedestrian Planning Policy Map, Figure 8a presents the City's existing bicycle routes, and Figure 8b presents the City's proposed bicycle network. As shown in the figures, Class II bicycle lanes (painted on-street lane) are proposed on Lenwood Road, between Agate Road to the north and Main Street to the south, and between High Point Parkway and Mercantile Way. This includes the segment of Lenwood Road along the project frontage. Class II bicycle lanes are also proposed on Main Street in the vicinity of the site. An east-west equestrian trail is also proposed south of Community Boulevard beginning near the western City limits and continuing east to the eastern City limits (San Bernardino County 2018).

3 Project Traffic

This section documents the trip generation, distribution, and assignment of project traffic in the study area.

3.1 Trip Generation

The estimated project trip generation is presented in Table 2. Trip generation estimates for the proposed commercial building and logistics facility are based on daily and AM and PM peak hour trip generation rates obtained from the Institute of Transportation Engineers (ITE) Trip Generation Handbook, 11th Edition (ITE 2021). Since there are no industry standard rates for EV charging stations, trip rates for the EV charging station (by charging/fuel type) are based on assumptions regarding the maximum charging capacity, utilization rates, and other anticipated site operations. The assumptions are outlined in detail in the trip generation table notes.

Additionally, passenger car equivalent (PCE) factors were applied to the trip generation estimates to account for truck traffic. The San Bernardino County Congestion Management Program (CMP) indicates that projects with high truck percentages should convert project trips to PCE. A 1.5 PCE factor was applied to 2-axle trucks, 2.0 PCE for 3-axle trucks, and a 3.0 PCE factor was applied to 4-axle trucks, per the San Bernardino County CMP (San Bernardino Associated Governments 2016). As the ITE Trip Generation Handbook does not provide a breakdown of truck traffic by axle classification, vehicle mix data and percentages are also applied to the project trip generation estimates from the Southern California Air Quality Management District (SCAQMD) Warehouse Truck Trip Study Data Results and Usage (SCAQMD 2014).

As shown in Table 2, the project would generate 5,580 daily trips, 429 AM peak hour trips, and 470 PM peak hour trips. This is equivalent to 7,466 daily PCEs, 567 AM peak hour PCEs, and 623 PM peak hour PCEs.

3.2 Trip Distribution and Assignment

Regional Project trip distribution percentages are based on logical travel paths to and from the project site, consideration of designated truck routes, and the traffic distribution patterns analyzed for a recently approved industrial project adjacent to the project site.

Project trip distribution percentages are shown in Figures 9 and 10, for passenger vehicle and truck trips, respectively. The project trip assignments are shown in Figures 11, 12, and 13 for passenger vehicle, truck, and total trip assignments, respectively.

4+-Axle Trucks		3.0	1,253	84	20	104	43	68	111

Table 2. Project Trip Generation

Land Use	ITE Code	Size/Units	Daily	AM Peak Hour			PM Peak Hour		
				In	Out	Total	In	Out	Total
Total Passenger Vehicles			1,760	118	28	146	61	95	156
Total Trucks			1,698	114	27	141	59	92	151
Warehouse Total (PCE)			3,458	232	55	287	120	187	307
Total Site Trip Generation (PCE)			7,466	376	191	567	280	343	623

Notes: Rounding discrepancies may occur. TSF = Thousand Square Feet; PCE = Passenger Car Equivalent

1 Trip rates from the Institute of Transportation Engineers (ITE), *Trip Generation, 11th Edition, 2021*

2 Assumes commercial land use consists of 12,000 SF of general commercial and 3,000 SF of fast food restaurant with drive-through. LOS = Level of Service

3 Based on assumed project operations, 40% of trucks would be 2-axle, 10% would be 3-axle, and 50% would be 4+-axle

4 Vehicle mix and percent from SCAQMD Warehouse Truck Trip Study Data Results and Usage, July 17, 2014.

5 Passenger Car Equivalent (PCE) factors from the San Bernardino County CMP, Appendix B - Guidelines for CMP Traffic Impact Analysis Reports in San Bernardino County, 2016.

6 Charging Station Assumptions:

Truck wash and truck maintenance facilities are ancillary to the Charging Station and will be used by trucks already on site. These land uses are not anticipated to generate additional trips, and are therefore not included in the trip generation table.

EV Autos- 8 DC Fast chargers

4 Level of Service (LOS) Methodology and Thresholds

San Bernardino County and the City of Barstow have vehicle LOS policies to ensure that proposed developments are consistent with their respective General Plans. Therefore, an LOS analysis has been prepared to evaluate the project's consistency with the County's General Plan Transportation and Mobility Element and the City's Circulation Element. Because the City does not have specific transportation impact analysis guidelines, the LOS analysis is based on the San Bernardino County Transportation Impact Study Guidelines (County Guidelines) (San Bernardino County 2019). The study intersection and roadway segments, analysis scenarios, traffic volumes, and LOS methodology and impact criteria are presented in the following section.

4.1 Study Intersections and Roadway Segments

The following intersections were selected for analysis:

1. Lenwood Road/SR-58 WB Ramps
2. Lenwood Road/SR-58 EB Ramps
3. Lenwood Road/Community Boulevard
4. Lenwood Road/Agate Road
5. Lenwood Road/Jasper Road
6. Lenwood Road/Main Street
7. Lenwood Road/Sun Valley Drive
8. Lenwood Road/Love's Travel Stop Driveway
9. Lenwood Road/High Desert Road
10. Lenwood Road/Chevron Driveway[1]
11. Lenwood Road/Commerce Parkway
12. I-15 SB Ramps/Lenwood Road
13. I-15 NB Ramps - High Point Parkway/Lenwood Road
14. SR-58 SB Ramps/Main Street
15. SR-58 NB Ramps/Main Street

In addition, the following road segment was selected for analysis:

1. Lenwood Road, south of Agate Road
2. Lenwood Road, south of Cam Del Sol

[1] For reference, the Chevron Driveway/Lenwood Road intersection is referred to as the Lenwood Road/Truck Freightliner Service Point Driveway intersection (#19) in the BIG Level of Service Assessment – Transportation Analysis.

4.2 Analysis Scenarios

Consistent with the County Guidelines, intersection LOS analyses were prepared for the weekday AM and PM peak hours at the study area intersections and road segment listed above for the following analysis scenarios:

- Existing Condition
- Background conditions (no Project) –Defined as Opening Year Conditions with ambient growth and traffic from approved projects
- Background conditions plus Project - Defined as background conditions plus traffic from the proposed project
- Cumulative Year (no project) - Defined as ambient growth to the Cumulative Horizon plus traffic approved and pending projects in the area
- Cumulative Year plus project - Defined as Cumulative No Project Conditions plus traffic from the proposed Project.

4.3 Traffic Volumes

Daily, AM and PM peak hour turning movements counts were collected at the study area intersections and roadways on May 11, 2023 during a non-holiday week while adjacent schools were in session. An annual growth rate of 1 percent (consistent with the County's Guidelines for the Desert Region) was applied to the traffic counts to reflect 2025 conditions.

The 2028 Opening Year condition represents a short-term horizon period (less than 5 years) where the proposed project is constructed and fully occupied. The peak hour traffic forecasts for the Year 2025 have been projected by increasing the traffic volumes by an annual growth rate of 1% per year, consistent with recent traffic studies conducted in the area, and adding traffic volumes generated by pending projects. These approved or pending projects are developments in the review process, but not fully approved; or, projects that have been approved, but not fully constructed or occupied. One cumulative project (BIG) was identified by the County and City in April 2025, and is further discussed in Section 6.1. The Horizon Year 2048 assumes buildout of the land uses designated in the County and the City's proposed General Plan Update, including the BIG project. General Plan Year volumes were obtained from the City of Barstow and BIG Project team. The volumes were derived from the San Bernardino Transportation Analysis Model (SBTAM) for the year 2048.

4.4 Analysis Methodology

LOS is commonly used as a qualitative description of intersection operations and roadway segments and is based on the design capacity of the intersection configuration and roadway facility, compared to the volume of traffic using the facility. The Town's intersection evaluation methodology to assess transportation impacts and traffic operating conditions for intersections is based on the latest version of the Highway Capacity Manual (HCM) methodology.

The HCM analysis methodology describes the operation of an intersection using a range of LOS from LOS A (free-flow conditions) to LOS F (severely congested conditions), based on the corresponding control delay experienced per vehicle based on the worst turning movement for unsignalized intersections.

Synchro version 12 software was used to determine intersection LOS (for all scenarios), consistent with HCM 7 methodologies. Table 3 shows the LOS values by delay ranges for unsignalized and signalized intersections under the HCM methodology.

Table 3. Levels of Service for Intersections using HCM Methodology

Level of Service	Unsignalized Intersections Control Delay (in seconds per vehicle)	Signalized Intersections Control Delay (in seconds per vehicle)
A	< 10.0	< 10.0
B	> 10.0 to < 15.0	> 10.0 to < 20.0
C	> 15.0 to < 25.0	> 20.0 to < 35.0
D	> 25.0 to < 35.0	> 35.0 to < 55.0
E	> 35.0 to < 50.0	> 55.0 to < 80.0
F	> 50.0	> 80.0

Source: HCM 7 (Transportation Research Board 2022).

Additionally, roadway segments are analyzed in the General Plan to determine their operating conditions based on the roadway segment LOS criteria based on the HCM. Table 4 identifies the traffic volume thresholds as described in the San Bernardino County Policy Plan Transportation Impact Analysis.

Table 4. Level of Service Criteria for Roadway Segments

Facility	Number of Lanes	Speed	LOS C	LOS D	LOS E
Divided Highway	6	55	72,000	81,000	100,000
	4	55	57,600	64,800	72,000
	2	55	28,800	32,400	36,000
Major Arterial/ Major Highway	6	55	48,000	54,000	60,000
		45	31,900	54,000	54,300
		40	26,700	51,500	54,300
		35	21,500	48,900	54,300
	4	45	21,400	37,200	37,900
		40	18,000	35,300	37,900
		35	14,700	33,300	37,900
	2	45	10,700	18,600	19,000
		40	9,000	17,700	19,000
		35	7,400	16,700	19,000

Source: San Bernardino County Policy Plan Transportation Impact Analysis (2019)

4.5 County General Plan Consistency Requirements

The project is located within the North Desert Region of the County. The San Bernardino County General Plan Transportation and Mobility Element (San Bernardino County 2020) contains the following policies related to transportation compliance and LOS requirements for the Desert region. The policies were used to identify the project's potential impacts on intersections and roadway LOS.

Signalized Intersection General Plan Consistency Requirements

- Any signalized study intersection in the Desert region that is operating at an LOS C or better without project traffic in which the addition of project traffic causes the intersection to degrade to an LOS D, E, or F shall identify improvements to improve operations to LOS C.
- Any signalized study intersection in the Desert region that is operating at LOS D, E, or F without project traffic where the project increases delay by 5.0 or more seconds shall identify improvements to offset the increase in delay.

Unsignalized Intersection General Plan Consistency Requirements

Consistent with the acceptable LOS for the Desert region as described in the current General Plan, the following unsignalized intersection criteria are used to identify operational deficiencies:

An operational improvement would be required if the study determines that either section a) or both sections b) and c) occur:

A. The addition of project related traffic causes the intersection to degrade from an LOS C or better to an LOS D or worse in the Desert region.

OR

B. The project adds 5.0 seconds or more of delay to an intersection that is already projected to operate without project traffic at an LOS D, E, or F in the Desert region (per Section 10.5.2 b)

AND

C. One or both of the following conditions are met:
    1. The project adds ten (10) or more trips to any minor street approach
    2. The intersection meets the peak hour traffic signal warrant after the addition of project traffic (per Section 10.5.2 c).

If the conditions above are satisfied, improvements should be identified that achieve the following:

- In the Desert region, improvements should be identified that would achieve LOS C or better for case a) above or to pre-project LOS and delay for case b) above

Roadway Segments

Consistent with the acceptable LOS for the Desert region as described in the current General Plan, the following roadway segment thresholds and improvement requirements are used to identify operational deficiencies:

- Any study roadway segment in the Desert region that is operating at an LOS C or better without project traffic in which the addition of project traffic causes the segment to degrade to an LOS D, E, or F should identify improvements to achieve LOS D.
- Any roadway segment that operates unacceptably in the no project scenario where the project adds traffic in excess of 5% of the roadway capacity (e.g., a volume-to-capacity ratio increase of 0.05) should identify improvements to add capacity to the segment

4.5.1 Improvements for Transportation Impacts

Per the County's TIS Guidelines, improvements for project level impacts should focus on providing operations that offset the project impact (e.g. achieve a "no project" level of service). Improvements could consist of signal timing improvements, lane restriping, or new lanes to study facilities. Cumulative impacts should include a fair-share contribution toward achieving acceptable levels of service as noted below. Alternatively, if a cumulative location is included in an existing traffic impact fee program, payment of those fees would constitute an appropriate contribution.

Fair Share Contribution

For improvements that are needed where the applicant is not solely responsible, a fair share computation should be computed and reported for each such mitigation. The fair share amount should be calculated using the following formula:

Project Fair Share = Project Trips / (Project Trips + Future Development Trips) X 100%

4.6 City of Barstow

The City of Barstow Circulation Element contains the following policies related to LOS:

> Policy 1.A: Continue to utilize Capital Improvement Program and Measure I funds to maintain and enhance the city's roadway network, retaining a minimum level of service of "C" along all roadways and at all intersections.

4.7 Caltrans Transportation Impact Study Guide

As the owner and operator of the State Highway System, Caltrans, implements established state planning priorities in all functional plans, programs, and activities. Caltrans has the responsibility to coordinate and consult with local jurisdictions when proposed local land use planning and development may impact state highway facilities. To comply with SB 743 implementation, the Caltrans Transportation Impact Study Guide (May 2020), replaced the Guide for the Preparation of Traffic Impact Studies (Caltrans 2002). Per the 2020 Transportation Impact Study Guide, Caltrans' primary review focus is VMT, replacing LOS as the metric used in CEQA transportation analyses. Caltrans recommends use of OPR's recommended thresholds and guidance on methods of VMT assessment found in OPR's Technical Advisory (OPR 2018). In addition to VMT, Caltrans has developed an Interim Land Development and Intergovernmental Review Safety Review Practitioners Guidance (July 2020) which may request a targeted operational and safety analysis to address a specific geometric or operational issue related to the State Highway System and connections with the State Highway System (Caltrans 2020). Since no operational issues (e.g., LOS impacts) were identified at the I-15 or SR-58 ramps, no further analysis is required.

INTENTIONALLY LEFT BLANK

5 Existing (2025) Conditions Analysis

This section details the existing intersection and roadway segment operations within the study area. Existing traffic controls and geometrics at all study intersections are shown in Figure 14 and existing peak hour traffic volumes are shown in Figure 15. Raw traffic counts are provided in Appendix B and all synchro LOS worksheets are in Appendix C.

5.1 Intersection Operations

Table 5 summarizes the results of the intersection analysis for the AM and PM peak hours for existing conditions. As shown in the table, all study intersections are currently operating at satisfactory levels of service (LOS C or better) under existing conditions.

Table 5. Existing Weekday Peak Hour Intersection LOS

No.	Intersection	Jurisdiction	Traffic Control	Existing			
				AM Peak		PM Peak	
				Delay[1]	LOS	Delay[1]	LOS
1	Lenwood Rd./SR-58 WB Ramps	County/ Caltrans	AWSC	7.1	A	7.2	A
2	Lenwood Rd./SR-58 EB Ramps	County/ Caltrans	AWSC	7.6	A	7.3	A

15	SR-58 NB Ramps/Main St.	Barstow/ Caltrans	Signal	6.7	A	7.8	A

Source: Appendix C
Notes: OWSC = one-way-stop-control; TWSC = two-way stop-control; AWSC = all-way stop-control; LOS = level of service; **Bold:** Exceeds LOS C threshold
[1] Delay in seconds per vehicle; highest movement delay is reported for OWSC/TWSC intersections.

5.2 Roadway Segment Operations

Table 6 shows the results of the roadway segment LOS analysis. As shown below, Lenwood Road is operating within the acceptable LOS C threshold under Existing conditions.

Table 6. Existing ADT Roadway Segment Level of Service

No	Roadway Segment	Classification	Speed	No. of Lanes	ADT	LOS C Threshold (ADT)	Threshold Exceeded?
Lenwood Road							
1	South of Agate Road	Major Highway	55 MPH	2	1,979	10,700	No
2	South of Cam Del Sol	Major Highway	55 MPH	2	1,940	10,700	No

Notes: MPH = miles per hour; ADT = average daily traffic; **Bold**: Exceeds "Acceptable" threshold

1 LOS threshold determined from Table 4 in Section 4.4, Analysis Methodology. No ADT threshold is provided for a 2-lane Major Highway with a posted speed of 55 MPH. Therefore, the ADT threshold is based on a 2-lane Major Highway with a posted speed of 45 MPH.

2 Volume provided from ADT counts conducted on May 11, 2023 and grown by 1% per year to reflect 2025 conditions.

INTENTIONALLY LEFT BLANK

6 Opening Year (2028) Analysis

This section presents the results of a cumulative condition analysis that was conducted for a short-term horizon year (Year 2028) assuming the proposed project is constructed and fully occupied.

6.1 Cumulative Projects

Cumulative projects are projects that are proposed and in the development review process, but not yet fully approved; or projects that have been approved, but not fully constructed or occupied. The following project listed in Table 7 was provided per communication with City staff and is included in the Opening Year analysis.

Table 7. Cumulative Projects

No	Name	Location	Description
1	Barstow International Gateway (BIG)	Generally, west of Lenwood Road and north of Main Street	4,500-acre new integrated rail facility on the west side of Barstow, consisting of a rail yard, intermodal facility and warehouses for transloading freight from international containers to domestic containers

Source: Correspondence with the City of Barstow and BIG project team, April 2025

The project trip generation for the BIG project was obtained from the City of Barstow and BIG project team and is presented in Table 8. As shown in Table 8, the BIG project would generate approximately 10,213 daily PCE trips, 714 AM peak hour PCE trips, and 859 PM peak hour PCE trips during the 2028 Opening Year. Figure 16 shows the location of the cumulative project and Figure 17 shows the traffic volumes distributed throughout the network.

Table 8. Cumulative Project Trip Generation (BIG)

Land Use	User	Daily	AM Peak Hour			PM Peak Hour		
			In	Out	Total	In	Out	Total
Transload Warehouse (21,000 SF)	Passenger Cars	6,962	306	48	354	137	394	531
	Trucks	195	9	9	18	4	5	9

	Truck PCE	998	30	20	50	25	15	40
	Total PCE	**2,763**	**163**	**152**	**315**	**158**	**147**	**305**
Passenger Cars Total		*8,727*	*439*	*180*	*619*	*270*	*526*	*796*
Truck Total (PCE)		*1,486*	*53*	*43*	*95*	*35*	*28*	*63*
Total (PCE)		**10,213**	**492**	**223**	**714**	**305**	**554**	**859**

Notes:
[1] Trip generation from BIG Project team, September 2025.

6.2 Intersection Operations

The existing intersection configurations have been assumed to be preserved under the Opening Year (2028) conditions. Figure 18 illustrates the Opening Year (2028) (no project) traffic volumes for the peak hour conditions and Figure 19 illustrates the Opening Year (2028) (with project) traffic volumes for the peak hour conditions.

Table 9 summarizes the results of the Opening Year (2028) intersection analysis for the AM and PM peak hours, with and without the project. As shown in the table, all of the study area intersections are forecast to operate at satisfactory levels of service (LOS C or better) under Opening Year (2028) conditions with and without project traffic, except for the following intersections:

			AM Peak hour		PM Peak Hour	
			Without Project	With Project	Without Project	With Project
#5	Lenwood Rd./Jasper Rd	TWSC	LOS E	LOS F	LOS F	same
#10	Lenwood Rd./Chevron Driveway	TWSC	LOS D	LOS E	LOS E	LOS F

To facilitate access to the proposed BIG transload warehouse center, BIG proposes realigning Hinkley Road to connect with the west leg of the Lenwood Road/Jasper Road intersection and installing a traffic signal, widening the roadway and restriping at the intersection. Signalization is warranted under the Opening Year (2028) conditions (Kimley Horn 2025) and would be implemented by BIG. With signalization and restriping, the intersection would operate at acceptable levels of service.

Recommended improvements at the Lenwood Road/Chevron Driveway include installing a signal and clustering the intersection with the existing signal at Commerce Parkway so they function as a combined system with a single controller. This configuration is recommended due to the proximity of the intersections, which supports synchronized signal operations and improved traffic flow (Kimley Horn 2025). The intersection would operate at LOS C or better with the improvements. The project would pay its fair share contribution toward the cost of the improvements.

Table 9. Opening Year (2028) Weekday Peak Hour Intersection LOS (with and without Project)

No.	Intersection	Traffic Control	Opening Year (2028)				Opening Year (2028) Plus Project				Change in Delay (Sec.)		Threshold Exceeded?

[1] Delay in seconds per vehicle; highest movement delay is reported for TWSC intersections.

6.3 Roadway Segment Operations

Table 10 shows the results of the roadway segment LOS analysis. As shown below, Lenwood Road is forecast to operate at acceptable conditions under Opening Year (2028) conditions with and without the addition of project traffic.

Table 10. Opening Year (2028) ADT Roadway Segment Level of Service

No	Roadway Segment	Classification	Speed	No. of Lanes	2028 ADT	2028 + Project ADT	LOS C Threshold (ADT)	Threshold Exceeded?
Lenwood Road								
1	South of Agate Road	Major Highway	55 MPH	2	2,037	2,836	10,700	No
2	South of Cam Del Sol	Major Highway	55 MPH	2	1,997	8,864	10,700	No

Notes: MPH = miles per hour; ADT = average daily traffic; **Bold**: Exceeds "Acceptable" threshold

1 LOS threshold determined from Table 4 in Section 4.4, Analysis Methodology. No ADT threshold is provided for a 2-lane Major Highway with a posted speed of 55 MPH. Therefore, the ADT threshold is based on a 2-lane Major Highway with a posted speed of 45 MPH.

2 Volume provided from ADT counts conducted on May 11, 2023 and grown by 1% per year to reflect 2028 conditions.

7 Horizon Year (2048)

This section describes conditions within the study area in the Horizon Year 2048.

7.1 Intersection Operations

The existing intersection configurations have been assumed to be preserved under the Horizon Year (2048) conditions. Figure 20 illustrates the Horizon Year (2048) (no project) traffic volumes for the peak hour conditions and Figure 21 illustrates the Horizon Year (2048) (with project) traffic volumes for the peak hour conditions.

Table 11 summarizes the results of the Horizon Year (2048) intersection analysis (with and without the project) for the AM and PM peak hours. As shown in the table, all study area intersections are forecast to operate at satisfactory levels of service (LOS C or better) under Horizon Year (2048) conditions with and without project traffic, except for the following intersections.

			AM Peak hour		PM Peak Hour	
			Without Project	With Project	Without Project	*With Project*
▪ #5	Lenwood Rd./Jasper Rd	TWSC	LOS F	same	LOS F	same
▪ #6	Lenwood Rd./Main St.	Signal	LOS D	same	LOS F	same
▪ #7	Lenwood Rd./Sun Valley Dr.	OWSC	LOS C	LOS D	LOS E	LOS F
▪ #8	Lenwood Rd./Love's Travel Stop Dwy	No control	LOS D	LOS E	LOS F	same
▪ #9	Lenwood Rd./High Desert Rd.	OWSC	LOS C	same	LOS C	LOS D
▪ #10	Lenwood Rd./Chevron Driveway	OWSC	LOS E	LOS F	LOS F	same

As previously noted, the proposed Hinkley Road/Jasper Road/Lenwood Road intersection will be signalized as part of the proposed BIG access improvements. In addition, the BIG project includes partial vacation of Sun Valley Drive which would result in the removal of the Lenwood Road/Sun Valley Road intersection with the BIG project. Therefore, no improvements are required at this intersection.

Improvements related to signalization and/or lane geometrics for the remaining intersections are identified in Section 9.

Table 11. Horizon Year (2048) Weekday Peak Hour Intersection LOS (with and without Project)

8 Project Access and Circulation

This section describes the proposed site access and roadway improvements, emergency access and pedestrian and bicycle access.

Site Access and Circulation

Access to the EV charging station would be via two full-access driveways along Lenwood Road, with the main driveway providing access to a four-lane internal road between the EV charging station and the logistics facility. Access to the logistics facility would be via six full access driveways along Lenwood Road, with access for both passenger cars and trucks, as shown in Figure 2. The driveways would vary in width from 30 feet to 50 feet. The project would provide a new 60-foot-wide roadway dedication providing future access to the property to the east of the site. Figure 22 presents the proposed 60-foot roadway section for the new public roadway proposed.

The HCM Synchro reports generated for the intersection LOS analyses provide preliminary queuing results for each of the project driveways. The reports show negligible queueing would occur at each of the driveways under all scenarios evaluated. Given the results of the HCM queuing reports, the proposed two-way left turn lane along the project frontage, and the low volume of through traffic on Lenwood Road, no off-site queuing issues are anticipated. As future development occurs along the west side of Lenwood Road, site access and potential off-site queuing should be evaluated as part of future development proposals.

Proposed Frontage Improvements

Lenwood Road is currently a two-lane north-south oriented roadway that is classified as a 104-foot wide Major Highway in the County's Circulation Master Plan. The project would improve the east side of Lenwood Road to its ultimate half-width along the project site's frontage including the construction of sidewalk, curb and gutter. This half section would contain a 10-foot shoulder, two 12-foot northbound travel lanes and half of a 12-foot center lane. The 10-foot shoulder would provide the dedicated right-of-way for implementation of a Class II bike lane as identified in the County's Circulation Master Plan (timing to be determined in consultation with the County). In addition, the project would add 6 feet of paving to the west half of Lenwood Road to accommodate the balance of the center striped median lane and would repave the existing southbound travel lane, to the extent such paving and re-paving have not already been completed by others. Further, the project would transition Lenwood Road back to existing width and provide striping north of the project boundary to Agate Road. See Figure 23, Proposed Lenwood Road Section, illustrating the proposed frontage improvements. These proposed improvements may be modified upon further review of the County Public Works and Land Use Services Departments. The right-of-way dedication for and construction of the ultimate width of the west side of Lenwood Road will be determined by future agreement between the City of Barstow and the County.

Emergency Access

All roadway, intersection and project access improvements would be overseen by the County and their qualified traffic engineers. This approach would ensure compliance with all applicable roadway design requirements. In the event of an emergency all the site access driveways would enable vehicles to enter/exit the project site. All street improvements will be designed with adequate width, turning radius, and grade to facilitate access by County's firefighting apparatus, and to provide alternative emergency ingress and egress. The site plan would be subject to

plan review by the County's Fire Department to ensure proper access for fire and emergency response is provided and required fire suppression features are included. Therefore, the project's impact due to inadequate emergency access would be less than significant. As such, no hazardous design features would be part of the project's roadway improvements or site access.

Pedestrian and Bicycle Access

The project site is primarily surrounded by vacant land with limited pedestrian or bicycle infrastructure provided. As described above, the project will construct sidewalk, curb and gutter along the project frontage, as well as provide the dedicated right-of-way for implementation of a Class II bike lane as identified in the County's Circulation Master Plan. As the adjacent areas surrounding the project site continue to develop, pedestrian and bicycle access will be improved.

Sidewalks are proposed throughout the project site providing pedestrian access to the various uses within the site, including the charging station, the commercial area, parking areas, and the logistics facility.

9 Recommended Improvements and Fair Share Contribution

This section presents the recommended intersection and roadway improvements required to meet the County and City's level of service standards, as well as the project's fair share contribution toward implementing the improvements.

9.1 Recommended Improvement Measures

Table 13 identifies intersection improvements that would be necessary to bring the study area intersections to acceptable operating conditions under Opening Year (2028) and Horizon Year (2048) plus Project conditions. Synchro worksheets, with the proposed improvements, are included in Appendix D.

Table 13. Recommended Improvement Measures

Intersection		Jurisdiction	Opening Year (2028) plus Project		Horizon Year (2048) plus Project	
			Improvement	LOS with Improvement	Improvement	LOS with Improvement
5	Lenwood Rd./ Jasper Rd.	Barstow/ County	Install signal and restripe all approaches[1] (City & County)	AM Peak Hour: LOS A PM Peak Hour: LOS A	Same	AM Peak hour: LOS A PM Peak Hour: LOS B
6	Lenwood Rd./ Main St.[2]	Barstow/ County	N/A	N/A	Restripe SB approach to provide a second SB left-turn lane. (City) Restripe SB right-turn lane into a through-right lane. (City) Reconfigure traffic island to provide space for additional SB through movement. (City) Restripe NB approach to provide a second NB left-turn lane. (County)	AM Peak hour: LOS C PM Peak Hour: LOS B
8	Lenwood Rd./Love's Travel Stop Dwy	Barstow	N/A	N/A	Install signal. Install fiber optic interconnect system between intersections Love's Travel Stop Driveway and Commerce Pkwy	AM Peak hour: LOS A PM Peak Hour: LOS A

Table 13. Recommended Improvement Measures

Intersection		Jurisdiction	Opening Year (2028) plus Project		Horizon Year (2048) plus Project	
			Improvement	LOS with Improvement	Improvement	LOS with Improvement
					and optimize signal timing for corridor. (City)	
9	Lenwood Rd./High Desert Rd.	Barstow	N/A	N/A	Install Signal (City)	AM Peak hour: LOS A PM Peak Hour: A
10	Lenwood Rd./Chevron Driveway	Barstow	Install signal and cluster intersection with signal at Commerce Pkwy. (City)[3]	AM Peak Hour: B PM Peak Hour: C	Same	AM Peak Hour: LOS B PM Peak Hour: LOS B

Source: Synchro Worksheets w/Improvements (Appendix D)
Notes:
1 Signalization and restriping improvements at the Lenwood Rd./Jasper Rd. intersection would be implemented by the Barstow International Gateway for their driveway.
2 The intersection jurisdiction is split between San Bernardino County and the City of Barstow. The County maintains Lenwood Road east of the centerline and Main Street east of Lenwood Road.
3 Cluster signalization identified by BIG project under 2033 conditions. Improvement would be implemented when signal warrant is met. Screenshot of LOS worksheet is provided in Appendix D as Synchro only provides read-only results for clustered signal analysis.

9.2 Fair Share Contribution

Table 14 provides a breakdown of the Project's fair share contributions to the above recommended improvements per the methodology provided in Chapter 4.5.1.

Table 14. Project's Fair Share Contribution

No.	Intersection	Peak Hour	Existing Traffic	Project Traffic	Horizon Year (2048) plus Project	% Project Traffic of Net New Traffic
5	Lenwood Rd./ Jasper Rd.	PM	402	554	1,847	30%
6	Lenwood Rd./ Main St.[1]	PM	696	554	3,110	18%
8	Lenwood Rd./ Love's Travel Stop Driveway	PM	397	256	1,939	13%
9	Lenwood Rd./ High Desert Road	PM	561	256	1,984	13%
10	Lenwood Rd./Chevron Driveway	PM	954	256	2,219	12%

Notes:
1 The intersection jurisdiction is split between San Bernardino County and the City of Barstow. The County maintains Lenwood Road east of the centerline and Main Street east of Lenwood Road.

Table 15 presents the estimated cost of the recommended improvements and the project's fair share cost to the improvement. A detailed summary of the costs and assumptions are provided in Appendix E.

Table 15. Project's Fair Share Cost Estimates

No.	Intersection	Improvement	Jurisdiction/ Estimated Total Cost	Fair Share Percentage	Cost to Developer
5	Lenwood Rd./ Jasper Rd.	Install traffic signal	City of Barstow $287,500 San Bernardino County $287,500	30%	City of Barstow $86,250 San Bernardino County $86,250
6	Lenwood Rd./ Main St.[1]	Restriping and reconfiguration of island	City of Barstow $41,470 San Bernardino County $6,152	18%	City of Barstow $7,465 San Bernardino County $1,107
8	Lenwood Rd./ Love's Travel Stop Driveway	Restriping, install signal interconnect system and traffic signal	City of Barstow $592,500	13%	City of Barstow $77,025
9	Lenwood Rd./ High Desert Road	Install traffic signal	City of Barstow $575,000	13%	City of Barstow $74,750
10	Lenwood Rd./Chevron Driveway	Install signal and cluster intersection	City of Barstow $592,500	12%	City of Barstow $71,100

Notes:

1 The intersection jurisdiction is split between San Bernardino County and the City of Barstow. The County maintains Lenwood Road east of the centerline and Main Street east of Lenwood Road.

INTENTIONALLY LEFT BLANK

10 Summary

The key findings of the analysis presented in this LTA are summarized below:

Project Trip Generation

- The proposed project would generate 5,580 daily trips, 429 AM peak hour trips, and 470 PM peak hour trips. This is equivalent to 7,466 daily PCEs, 567 AM peak hour PCEs, and 623 PM peak hour PCEs.

Level of Service Analysis

Existing Conditions

- All of the study area intersections are currently operating at LOS C or better under existing conditions.

Opening Year (2028) conditions

- All of the study area intersections are forecast to operate at LOS C or better, with and without the project, except for:
  - **Lenwood Road/Jasper Road (#5).** BIG proposes realigning Hinkley Road to connect with the west leg of the Lenwood Road/Jasper Road intersection and installing a traffic signal, widening the roadway and restriping at the intersection. Signalization is warranted under the Opening Year (2028) conditions (Kimley Horn 2025) and would be implemented by BIG. With signalization, the intersection would operate at acceptable levels of service.
  - **Lenwood Road/Chevron Driveway (#10).** The intersection is forecast to operate at LOS D under the Opening Year (2028) AM scenario and at LOS E under the PM scenario, and at LOS E and F under the Opening Year (2028) plus Project AM and PM scenarios respectively. With the addition of signalization and clustering the signal with the Lenwood Road/Commerce Parkway signal, the intersection would operate at acceptable levels of service. The project would contribute its fair share cost toward this improvement. Implementation of this improvement would occur when signal warrants are met.

Horizon Year (2048) conditions

- All of the study area intersections are forecast to operate at LOS C or better, with and without the project, except for:
  - **Lenwood Road/Jasper Road (#5).** As noted above, as part of the BIG access improvements, the Lenwood Road/Jasper Road intersection will be signalized. With signalization, the intersection would operate at acceptable levels of service.
  - **Lenwood Road/Main Street (#6).** The intersection is forecast to operate at LOS D during the Horizon Year (2048) AM scenario, with and without the project, and LOS F during the Horizon Year (2048) PM scenario, with and without the project. With restriping the northbound and southbound approaches, the intersection would operate at acceptable levels of service. The project would contribute its fair share cost toward this improvement.
  - **Lenwood Road/Love's Travel Stop Driveway (#8).** The intersection is forecast to operate at LOS D during the Horizon Year (2048) AM scenario and LOS E during the Horizon Year (2048) PM scenarios. The

intersection is forecast to operate at LOS E and F during the Horizon Year (2048) plus Project AM and PM scenarios, respectively. With signalization, the intersection would operate at acceptable levels of service. The project would contribute its fair share cost toward this improvement.

- **Lenwood Road/High Desert Road (#9).** The intersection is forecast to operate at LOS D under the Horizon Year (2048) plus Project PM Scenario. With the addition of signalization, the intersection would operate at acceptable levels of service. The project would contribute its fair share cost toward this improvement.
- **Lenwood Road/Chevron Driveway (#10).** The intersection is forecast to operate at LOS E under the Horizon Year (2048) AM scenario and at LOS F under the Horizon Year (2048) PM scenario, with and without the project. With the addition of signalization and clustering the signal with the Lenwood Road/Commerce Parkway signal, the intersection would operate at acceptable levels of service. The project would contribute its fair share cost toward this improvement.

Road Segment Analysis

- The road segment of Lenwood Road, between Agate Road and Cam Del Sol is operating at acceptable conditions under Existing Year conditions and will continue to operate at acceptable conditions under Opening Year (2028) and Horizon Year (2048) conditions, with and without the project traffic.

Queuing Analysis

- The proposed project would not result in unacceptable queueing conditions into or out of the project site.

Frontage Improvements

- The project would improve the east side of Lenwood Road to its ultimate half-width along the project site's frontage including the construction of sidewalk, curb and gutter. This half section would contain a 10-foot shoulder, two 12-foot northbound travel lanes and half of a 12-foot center lane. The 10-foot shoulder would provide the dedicated right-of-way for implementation of a Class II bike lane as identified in the County's Circulation Master Plan (timing to be determined in consultation with the County). In addition, the project would add 6 feet of paving to the west half of Lenwood Road to accommodate the balance of the center striped median lane and would repave the existing southbound travel lane, to the extent such paving and re-paving have not already been completed by others. The right-of-way dedication for and construction of the ultimate width of the west side of Lenwood Road will be determined by future agreement between the City of Barstow and the County.

MEMORANDUM

To:	City of Barstow - Rochelle Clayton, City Manager; Matthew Summers, City Attorney; Chris Heldreth, Community Development Department Director
From:	Lisa Valdez, Senior Transportation Planner
Subject:	Electrical Vehicle Charging Station and Logistics Facility Project, Lenwood, San Bernardino County
Date:	June 25, 2024, revised December 13, 2024, revised April 4, 2025
cc:	Vanessa Norwood, Contract Planning Manager, County of San Bernardino Land Use Services; Jon Braginton, Planner, County of San Bernardino Land Use Services; Phil Angelides, EVC Partners LLC; Brian Vail, EVC Partners; Greg Devereaux, Worthington Partners; David Mlynarski, Transtech
Attachment(s):	Attachment A: Project Trip Generation table (Table 2) Attachment B: Figures 1-8 Attachment C: SBCTA VMT Screening Tool results Attachment D: DEA Comments on Transportation Scoping memo Attachment E: Fehr & Peers comments on Transportation Scoping memo Attachment F: City of Barstow comments on Transportation Scoping memo Attachment G: Transportation Scoping Response to Comments Memo Attachment H: County of San Bernardino Scoping Correspondence and Approval Attachment I: Original Approved Scoping Memo to County, November 2023 (project has since been modified)

Dudek has prepared the following transportation scoping memorandum for the proposed Lenwood EV Charging Station and Logistics Facility Project (project) to be located on Lenwood Road between California Highway 58 (CA 58) and Interstate 15 (I-15), in the County of San Bernardino (Figure 1, Project Location). This scoping memo has been revised based on comments received from David Evans and Associates (February 7, 2025 & November 18, 2024; see Attachment D) on the transportation scoping memo submitted to the City of Barstow on June 25, 2024 (November 18, 2024 comments) and as revised December 13, 2024 (February 7, 2025 comments). Additional comments were received from Fehr & Peers (Attachment E) and the City of Barstow (Attachment F) in March 2025. This scoping memo was originally approved by San Bernardino County in November 2023 (see Attachment I). The project was modified several times since November 2023 and scoping for the current project (as described in this memo) was approved by the County in April 2024 (see Attachment H).

The memo describes the anticipated trip generation and trip distribution of the proposed project and provides the proposed analysis methodology for the Transportation Impact Study (TIS) based on the requirements and policies from the San Bernardino County's (County) Transportation Impact Study Guidelines (July 2019), the San Bernardino County Transportation Authority's (SBCTA) Congestion Management Program (CMP), the City of Barstow Circulation Element (2015), and Caltrans Transportation Impact Study Guide (May 2020).

Project Description

The approximately 100-acre Project site includes four parcels (049-714-203, 049-714-204, 049-714-214, and 049-714-215) and is located on Lenwood Road between CA 58 and Interstate-15, approximately one mile west of CA 58 and four miles west of downtown Barstow. The Project site is undeveloped and surrounded by undeveloped lands with the exception of a single-family residential neighborhood, High Desert Estates, located adjacent to the southern Project boundary.

The project site plan is provided as Figure 2, and a summary of the proposed land uses is presented in Table 1. The Project is proposing development on approximately 20-acres in the southern portion of the site with an electric vehicle charging hub for light duty/passenger vehicles and medium and heavy-duty trucks. The site will have a range of EV chargers to serve different charging needs (e.g., automobiles vs medium and heavy-duty trucks; slower chargers for overnight truck charging vs: fast charging for trucks, etc.). The EV charging station will include a commercial building of up to 15,000 square feet (SF) that will contain ancillary uses (e.g., food, convenience services, amenities for site users, etc.) for those using the station, as well as for local residents and nearby light industrial uses. The remaining site is proposed to include three warehouse buildings of 447,144 SF each, for a total of 1,341,432 SF of light industrial warehouse, logistic, and distribution facilities. Access would be provided from Lenwood Road via eight driveways. Figure 3 presents the proposed 60-foot roadway section for the new public roadway proposed between the EV charging station and the logistics facility.

Table 1. Summary of Proposed Project Components

	Land Use	Size
EV Charging Station	Truck Chargers	45 chargers
	Auto Chargers	8 chargers
	Truck Wash	6,000 SF; 2 lanes
	Truck Maintenance	4,000 SF; 4 bays
Commercial	Retail	12,000 SF
	Fast Food with Drive-thru	3,000 SF
Warehouse	Building A	447,144 SF
	Building B	447,144 SF
	Building C	447,144 SF
	Subtotal	*1,341,432 SF*

Notes: SF = square feet

Proposed Frontage Improvements

Lenwood Road is currently a two-lane north-south oriented roadway that is classified as a 104-foot wide Major Highway in the County's Circulation Master Plan. The project would improve the east side of Lenwood Road to its ultimate half-width along the project site's frontage including the construction of sidewalk, curb and gutter. This half section would contain a 10-foot shoulder, two 12-foot northbound travel lanes and half of a 12-foot center

lane. The 10-foot shoulder would provide the dedicated right-of-way for implementation of a Class II bike lane as identified in the County's Circulation Master Plan (timing to be determined in consultation with the County). In addition, the project would add 6 feet of paving to the west half of Lenwood Road to accommodate the balance of the center striped median lane and would repave the existing southbound travel lane, to the extent such paving and re-paving have not already been completed by others. See Figure 7, Proposed Lenwood Road Section, illustrating the proposed frontage improvements. For reference, Figure 8 is also provided and shows the County's typical section for a Major Highway. These proposed improvements may be modified upon further review of the County Public Works and Land Use Services Departments. The right-of-way dedication for and construction of the ultimate width of the west side of Lenwood Road will be determined by future agreement between the City of Barstow and the County.

Trip Generation

The estimated project trip generation is summarized in Table 2 (Attachment A). Trip generation estimates for the proposed commercial and warehouse uses are based on daily and AM and PM peak hour trip generation rates obtained from the Institute of Transportation Engineers (ITE) Trip Generation Handbook, 11th Edition (2021). Since there are no industry standard rates for EV charging stations, trip rates for the charging station (by charging type) are based on assumptions regarding the maximum charging capacity, utilization rates, and other anticipated site operations. The assumptions are outlined in detail in the trip generation table notes.

Additionally, Passenger car equivalent (PCE) factors were applied to the trip generation estimates to account for truck traffic. The San Bernardino County Congestion Management Plan (CMP) indicates that projects with high truck percentages should convert project trips to PCE. A 1.5 PCE factor was applied to 2-axle trucks, 2.0 PCE for 3-axle trucks, and a 3.0 PCE factor was applied to 4-axle trucks per the San Bernardino County CMP. As the ITE Trip Generation Handbook does not provide a breakdown of truck traffic by axle classification, vehicle mix data and percentages are also applied to the project trip generation estimates from the 2014 SCAQMD Warehouse Truck Trip Study Data Results and Usage (SCAQMD Study).

As shown in the Table 2, the project would generate 5,580 daily trips, 429 AM peak hour trips, and 470 PM peak hour trips. This is equivalent to 7,466 daily PCEs, 567 AM peak hour PCEs, and 623 PM peak hour PCEs.

Trip Distribution

Project trip distribution percentages are based on logical travel paths to and from the project site to major highway corridors and the City's designated truck routes. The preliminary project trip distribution percentages are shown in Figures 4 and 5, for passenger vehicle and truck trips, respectively. The total project trip assignment (in PCE) is provided as Figure 6.

Level of Service Analysis

Per the County's TIS guidelines, an LOS analysis would be required at intersections (of Collector or higher designated streets) where projects would generate 50 or more peak hour trips. In addition, intersections #7-10 were included

at the request of the City of Barstow. As such, the following intersection and roadway segments were selected for analysis:

Intersections

1. Lenwood Road/SR-58 WB Ramps
2. Lenwood Road/SR-58 EB Ramps
3. Lenwood Road/Community Boulevard
4. Lenwood Road/Agate Road
5. Lenwood Road/Jasper Road
6. Lenwood Road/Main Street
7. Lenwood Road/Sun Valley Drive
8. Lenwood Road/Love's Travel Stop Driveway
9. Lenwood Road/High Desert Road
10. Lenwood Road/Chevron Driveway
11. Commerce Parkway/Lenwood Road
12. I-15 SB Ramps/Lenwood Road
13. I-15 NB Ramps - High Point Parkway/Lenwood Road
14. SR-58 SB Ramps/Main Street
15. SR-58 NB Ramps/Main Street

Study Roadway Segments

1. Lenwood Road, south of Agate Road
2. Lenwood Road, south of Cam Del Sol

Analysis Scenarios

The intersection LOS analyses will be prepared for the weekday AM and PM peak hours at the study area intersections listed above for the following analysis scenarios:

- Existing conditions
- Background conditions (no Project) –Defined as Opening Year Conditions with ambient growth and traffic from approved projects
- Background conditions plus Project - Defined as background conditions plus traffic from the proposed project
- Cumulative Year (no project) - Defined as ambient growth to the Cumulative Horizon plus traffic approved and pending projects in the area
- Cumulative Year plus project - Defined as Cumulative No Project Conditions plus traffic from the proposed Project.

Project Opening Year baseline conditions will be developed from a "build-up" method based on the application of cumulative project trip generation estimates and an ambient growth rate (1%), added to the existing traffic volumes. The growth rate is based on the growth rate identified for the Desert region in the County's Transportation Scoping form (Attachment I). Trip generation estimates for cumulative projects in the Opening Year condition will be based on trip rates in ITE's Trip Generation, 11th Edition, or from their respective traffic studies and/or CEQA documents

(if available). Dudek will obtain a list of cumulative projects from the City of Barstow Community Development Department and the County of San Bernardino Land Use Services Department.

Horizon Year (2040) traffic volumes will be obtained from the SBCTA's San Bernardino Transportation Analysis Model (SBTAM). Baseline and Plus Project traffic volumes from SBTAM will be post-processed to model specifications.

LOS analyses will be prepared consistent with County's requirements which is based on the Highway Capacity Manual (HCM) methodology. The operational analysis will be conducted using Synchro/SimTraffic analysis software to reflect the effect of downstream congestion more accurately on intersection operations. In addition, queues will be determined at key storage (turn) lanes.

Traffic Counts

New AM and PM peak hour and daily roadways traffic counts were collected at the study area intersections and roadways on May 11, 2023 during a non-holiday week while adjacent schools were in session. An annual growth rate of 1 percent (consistent with the County's Guidelines for the Desert Region) will be applied to the traffic counts to reflect 2025 conditions.

Vehicle Miles Traveled Screening Analysis and Approach

Consistent with the screening thresholds identified in the County Guidelines, the SBCTA VMT Screening Tool was used to aid in the VMT screening process. The County Guidelines state that a project may have a less than significant impact and screen out of requiring a project-level VMT analysis if it meets at least one of the County's following VMT screening criteria:

- Local Serving Project Screening
- Projects Generating Less than 110 Daily Vehicle Trips
- Transit Priority Area (TPA) Screening
- Low VMT Area Screening

Local Serving Project Screening

The County Guidelines suggest Local-Serving Retail under 50,000 square feet and Local Essential Services such as K-12 schools, day care centers, and community institutions shortens nondiscretionary trips by putting those goods and services closer to residents, resulting in an overall reduction in VMT.

The Project includes amenities that cater to both local residents and motorists traveling along Lenwood Road, I-15, and SR-58. It includes EV charging facilities that will primarily serve vehicles already using the adjacent freeways. This component, although not strictly local-serving in nature, does not generate additional trips that were not already occurring. By offering dining, retail/convenience shopping, and EV charging opportunities, the Project is expected to shorten vehicle trips for both local residents and passing motorists. Thus, the Project's EV charging and retail components qualify for exemption from a VMT assessment under the County Guidelines. Therefore, the Local Serving Project screening criteria is partially met for the EV charging station and commercial building.

Projects Generating Less Than 110 Daily Vehicle Trips

The County Guidelines state projects generating less than 110 daily vehicles trips are presumed to have a less than significant impact on VMT. As previously discussed, the Project is forecast to generate 5,580 daily trips and is above the 110 daily trip threshold. Therefore, this criterion is not met.

Transit Priority Area (TPA) Screening

The County Guidelines state that projects located within a TPA (i.e., within ½ mile of an existing "major transit stop" or an existing stop along a "high-quality transit corridor") may be presumed to have a less-than-significant impact absent substantial evidence to the contrary. Based on the Screening Tool results presented in Attachment C, the project site is not located within ½ mile of an existing major transit stop, or along a high-quality transit corridor. Therefore, the TPA screening criteria is not met.

Low VMT Area Screening

As noted in the County Guidelines, "development in efficient areas of the County will reduce VMT per person/employee and is beneficial to the region". The County Guidelines state that projects with VMT per person/employee lower than 4% below the existing VMT per person for the unincorporated County are considered to have a less-than-significant VMT impact.

It is general industry practice to perform a secondary evaluation to identify if a project is consistent with the existing land use within that traffic analysis zone or Transportation Analysis Zone (TAZ) and use professional judgement that there is nothing unique about the project that would otherwise be mis-represented using data from the travel demand model. Existing land use information was examined in the SBTAM model for the project's TAZ 53962201 and was found to contain land use information that would be inconsistent with the project. Therefore, the project does not qualify for this screening criteria.

The project's EV charging station and commercial component was found to meet the Local Serving Project screening criteria. However, the remaining industrial component of the project does not meet eligible screening criteria. Therefore, a project-level VMT analysis will be prepared, as further described below.

VMT Analysis Approach

Dudek will prepare a project-level VMT analysis consistent with the County's requirements and the Governor's Office of Planning and Research's (OPR) Technical Advisory on Evaluating Transportation Impacts in CEQA (December 2018). The Project's VMT and the forecast regional VMT will be calculated using the SBTAM. Dudek will contract with the transportation firm authorized to run the model. The traffic analysis zone or TAZ of the Project site will be modified with the Project's proposed land uses, and a Select Zone model run will be performed to determine the Project's trip assignment. As part of the Select Zone run, the VMT estimate of the Project's TAZ will be determined. Then, the regional VMT estimate for the study area region (extent to be determined by the County) will also be provided from SBTAM. VMT estimates will be analyzed for the Baseline plus Project and Cumulative plus Project conditions.

If VMT impacts are identified, Dudek will coordinate with the County to determine the appropriate VMT reduction strategies provided in their VMT guidelines, and other resources noted in the OPR and Caltrans Technical Advisories (or other approved sources) to mitigate Project impacts.

Access, Circulation, and Safety

Dudek will qualitatively analyze the transit, pedestrian, and bicycle facilities that serve the project site. Project access and on-site circulation will be based on the County's Standard Plans/Drawings for access and on-site circulation design requirements. Vehicular queuing at the project's driveways will be analyzed for adequacy based on the 95th percentile (design) queues. For any significant project traffic impacts found, Dudek will determine appropriate and feasible mitigation measures to offset significant project impacts.

RE: 3RD REVIEW OF THE TRAFFIC IMPACT ANALYSIS SCOPING AGREEMENT FOR THE ELECTRIC VEHICLE CHARGING STATION AND LOGISTICS FACILITY PROJECT, SAN BERNARDINO COUNTY, CALIFORNIA

Dear Brad,

David Evans and Associates, Inc. (DEA) a review of the December 13, 2024, scoping agreement for the Electric Vehicle Charging Station and Logistics Facility project and Attachments prepared by DUDEK. Our comments are summarized in this letter.

We conducted two levels of review:

1) The first level focused on the scope's consistency with the established guidelines for preparing level of service conformance studies (traffic impact analysis) and Vehicle Miles Traveled (VMT) analyses for environmental review under CEQA.

   In 2020, the Barstow City Council adopted a resolution to establish a preferred method of estimating vehicle miles traveled (VMT) and a threshold of significance for identifying impacts in accordance with SB 743. The resolution, *A Resolution of The City Council of The City of Barstow Adopting "Vehicle Miles Traveled" Thresholds of Significance for Purposes of Analyzing Transportation Impacts Under the California Environmental Quality Act*), identifies the method of determining VMT by using SBCTA's San Bernardino Traffic Analysis Model (SBTAM)) and the metric (VMT/Service Population) for measuring project-generated VMT impacts.

   The resolution includes criteria for screening land development proposals for requiring VMT impact analysis under CEQA.

   Because the City of Barstow has not adopted transportation impact analysis guidelines for identifying level of service deficiencies, our review compared the Electric Vehicle Charging Station and Logistics Facility project scope against San Bernardino County's *Transportation Impact Study Guidelines* (July 9, 2019) which was the basis of DUDEK' scope agreement.

2) The second level of review evaluated the results of specific methodologies presented in the scope for accuracy and reasonableness. This level of review is limited to the estimated trip generation of the Electric Vehicle Charging Station and Logistics Facility project.

DAVID EVANS AND ASSOCIATES INC.

The following sections provide our comments on the DUDEK scope reviewed for consistency to the San Bernardino County's guidelines:

1. Project Description

    a. As previously commented, include all land uses in the project description with a breakdown of building square footage for each land use.

2. Project Site Plan

    a. The number of driveways proposed along Lenwood Road is unacceptable. Consolidate driveways to a maximum of four locations. Revise the site plan and trip distribution accordingly.

3. Project Site Access and On-Site Circulation

    a. As previously commented, frontage improvements discussion must include the complete typical section description, i.e.. the 10 foot shoulder.

4. Trip Generation Rates

    a. Provide information on the trip generation calculation for the Truck Wash and Truck Maintenance. Are they included in another land use? The Trip Generation Table does not make reference to either land use.

    b. As previously commented, the peak hour trips calculated for the EV Truck Chargers does not match the assumptions provided on Attachment A Trip Generation Table page 2.

    c. Verify the EV Truck Chargers project trips. If accurate, update the footnote 6 of the assumptions provided on Attachment A Trip Generation Table page 2 detailing the percentage of daily total occurs during AM peak and PM peak.

    d. As previously commented, the EV Truck Chargers peak hour trips PCE calculation needs to be updated based on the revised volumes generated by the changes outlined in comment 3b.

5. Trip Distribution
    a. Verify PM entering volumes.

    b. Balance trip volumes between project driveways.

6. Traffic Study Scenarios

    a. If not provided by the applicant, assume a project opening year two years from the date of the traffic counts (e.g., counts conducted in 2024 – assume opening year of 2026).

    b. The ambient growth rate of 1% assumption and any information supporting the assumptions (e.g., used in previously approved TIAs, derived from the SBTAM model, etc.)

7. Traffic Volumes

    a. As outlined in the San Bernardino County Scope for Traffic Study, traffic counts must not be older than 1 year prior to submittal unless approved by County Traffic.

DAVID EVANS AND ASSOCIATES INC.

Should you have any questions, please call me at 909-912-7304.

Sincerely,

DAVID EVANS AND ASSOCIATES, INC.

RE: REVIEW OF THE TRAFFIC IMPACT ANALYSIS SCOPING AGREEMENT FOR THE ELECTRIC VEHICLE CHARGING STATION AND LOGISTICS FACILITY PROJECT, SAN BERNARDINO COUNTY, CALIFORNIA

Dear Brad,

David Evans and Associates, Inc. (DEA) a review of the June 25,2024, scoping agreement for the Electric Vehicle Charging Station and Logistics Facility project and Attachments prepared by DUDEK. Our comments are summarized in this letter.

We conducted two levels of review:

1) The first level focused on the scope's consistency with the established guidelines for preparing level of service conformance studies (traffic impact analysis) and Vehicle Miles Traveled (VMT) analyses for environmental review under CEQA.

   In 2020, the Barstow City Council adopted a resolution to establish a preferred method of estimating vehicle miles traveled (VMT) and a threshold of significance for identifying impacts in accordance with SB 743. The resolution, *A Resolution of The City Council of The City of Barstow Adopting "Vehicle Miles Traveled" Thresholds of Significance for Purposes of Analyzing Transportation Impacts Under the California Environmental Quality Act*), identifies the method of determining VMT by using SBCTA's San Bernardino Traffic Analysis Model (SBTAM)) and the metric (VMT/Service Population) for measuring project-generated VMT impacts.

   The resolution includes criteria for screening land development proposals for requiring VMT impact analysis under CEQA.

   Because the City of Barstow has not adopted transportation impact analysis guidelines for identifying level of service deficiencies, our review compared the Electric Vehicle Charging Station and Logistics Facility project scope against San Bernardino County's *Transportation Impact Study Guidelines* (July 9, 2019) which was the basis of DUDEK' scope agreement.

2) The second level of review evaluated the results of specific methodologies presented in the scope for accuracy and reasonableness. This level of review is limited to the estimated trip generation of the Electric Vehicle Charging Station and Logistics Facility project.

DAVID EVANS AND ASSOCIATES INC.

The following sections provide our comments on the GTS scope reviewed for consistency to the San Bernardino County's guidelines:

1. Project Description

    a. In the project description breakdown, the commercial uses to be Retail and Fast Food with drive-thru window.

2. Project Site Access and On-Site Circulation

    a. Frontage improvements discussion must include the complete typical section description, i.e.. the 10 foot shoulder.

    b. The site plan is unreadable. Provide a legible site plan.

3. Trip Generation Rates

    a. The trip generation rate calculation for the EV Chargers is acceptable.

    b. The peak hour trips calculated for the EV Truck Chargers does not match the assumptions provided on Attachment A Trip Generation Table page 2. The assumption states that AM peak is 6% of daily and PM is 7% of daily trips. Recalculate these numbers and update the volumes accordingly.

    c. The EV Truck Chargers peak hour trips PCE calculation needs to be updated based on the revised volumes generated by the changes outlined in comment 3b.

4. Trip Distribution

    a. Provide an exhibit showing total PCE project trips at each study intersection by movement.

5. Study Intersections

    a. The identified study intersections in the scope agreement are acceptable.

6. Traffic Study Scenarios

    a. If not provided by the applicant, assume a project opening year two years from the date of the traffic counts (e.g., counts conducted in 2024 – assume opening year of 2026).

    b. Provide the ambient growth rate assumption and any information supporting the assumptions (e.g., used in previously approved TIAs, derived from the SBTAM model, etc.)

7. Vehicle Miles Traveled (VMT)

    a. The VMT screening analysis needs to be included in the scope agreement.

Should you have any questions, please call me at 909-912-7304.

Sincerely,

DAVID EVANS AND ASSOCIATES, INC.

MEMORANDUM

To:	Fidel Martinez, Engineering Services Division, City of Barstow
From:	Lisa Valdez, Senior Transportation Planner
Subject:	Electrical Vehicle Charging Station and Logistics Facility Project, Lenwood, San Bernardino County
Date:	June 25, 2024, revised December 13, 2024
cc:	Phil Angelides, EVC Partners LLC
Attachment(s):	Attachment A: Project Trip Generation table (Table 1) Attachment B: Figures 1-5 Attachment C: SBCTA VMT Screening Tool results Attachment D: DEA Comments on Transportation Scoping memo Attachment E: County of San Bernardino Scoping Correspondence and Approval Attachment F: Original Approved Scoping Memo to County, November 2023 (project has since been modified)

Dudek has prepared the following transportation scoping memorandum for the proposed Lenwood EV Charging Station and Logistics Facility Project (project) to be located on Lenwood Road between California Highway 58 (CA 58) and Interstate 15 (I-15), in the County of San Bernardino (Figure 1, Project Location). This scoping memo has been revised based on comments received from David Evans and Associates (November 18, 2024; see Attachment D) on the transportation scoping memo submitted to the City of Barstow on June 25, 2025. This scoping memo was originally approved by San Bernardino County in November 2023 (see Attachment F). The project was modified several times since November and scoping for the current project (as described in this memo) was approved by the County in April 2024 (see Attachment E).

The memo describes the anticipated trip generation and trip distribution of the proposed project and provides the proposed analysis methodology for the Transportation Impact Study (TIS) based on the requirements and policies from the San Bernardino County's (County) Transportation Impact Study Guidelines (July 2019), the San Bernardino County Transportation Authority's (SBCTA) Congestion Management Program (CMP), the City of Barstow Circulation Element (2015), and Caltrans Transportation Impact Study Guide (May 2020).

Project Description

The approximately 100-acre Project site includes four parcels (049-714-203, 049-714-204, 049-714-214, and 049-714-215) and is located on Lenwood Road between CA 58 and Interstate-15, approximately one mile west of CA 58 and four miles west of downtown Barstow. The Project site is undeveloped and surrounded by undeveloped lands with the exception of a single-family residential neighborhood, High Desert Estates located adjacent to the southern Project boundary. The Project is proposing development on approximately 20-acres in the southern portion of the site with an electric vehicle charging hub for light duty/passenger vehicles and medium and heavy-duty trucks. The site will have a range of EV chargers to serve different charging needs (e.g., automobiles vs medium and heavy-duty trucks; slower chargers for overnight truck charging vs: fast charging for trucks, etc.). The EV charging station will include a commercial building of up to 15,000 square feet (SF) that will contain ancillary uses

(e.g., food, convenience services, amenities for site users, etc.) for those using the station, as well as for local residents and nearby light industrial uses. The remaining site is proposed to include three warehouse buildings of 447,144 SF each, for a total of 1,341,432 SF of light industrial warehouse, logistic, and distribution facilities. Access would be provided from Lenwood Road via eight driveways.

Proposed Frontage Improvements

Lenwood Road is currently a two-lane north-south oriented roadway that is classified as a 104-foot wide Major Highway in the County's Circulation Master Plan. The project would improve the east side of Lenwood Road to its ultimate half-width along the project site's frontage including the construction of sidewalk, curb and gutter. This half section would contain two northbound travel lanes and half of a 12-foot center lane. In addition, the project would add 6 feet of paving to the west half of Lenwood Road to accommodate the balance of the center striped median lane and would repave the existing southbound travel lane, to the extent such paving and re-paving have not already been completed by others. These proposed improvements may be modified upon further review of the County Public Works and Land Use Services Departments. The right-of-way dedication for and construction of the ultimate width of the west side of Lenwood Road will be determined by future agreement between the City of Barstow and the County.

Trip Generation

The estimated project trip generation is summarized in Table 1 (attached). Trip generation estimates for the proposed commercial and warehouse uses are based on daily and AM and PM peak hour trip generation rates obtained from the Institute of Transportation Engineers (ITE) Trip Generation Handbook, 11th Edition (2021). Since there are no industry standard rates for EV charging stations, trip rates for the charging station (by charging type) are based on assumptions regarding the maximum charging capacity, utilization rates, and other anticipated site operations. The assumptions are outlined in detail in the trip generation table notes.

Additionally, Passenger car equivalent (PCE) factors were applied to the trip generation estimates to account for truck traffic. The San Bernardino County Congestion Management Plan (CMP) indicates that projects with high truck percentages should convert project trips to PCE. A 1.5 PCE factor was applied to 2-axle trucks, 2.0 PCE for 3-axle trucks, and a 3.0 PCE factor was applied to 4-axle trucks per the San Bernardino County CMP. As the ITE Trip Generation Handbook does not provide a breakdown of truck traffic by axle classification, vehicle mix data and percentages are also applied to the project trip generation estimates from the 2014 SCAQMD Warehouse Truck Trip Study Data Results and Usage (SCAQMD Study).

As shown in the Table 1, the project would generate 5,580 daily trips, 436 AM peak hour trips, and 470 PM peak hour trips. This is equivalent to 7,466 daily PCEs, 581 AM peak hour PCEs, and 623 PM peak hour PCEs.

Trip Distribution

Project trip distribution percentages are based on logical travel paths to and from the project site to major highway corridors and the City's designated truck routes. The preliminary project trip distribution percentages are shown in Figures 3 and 4, for passenger vehicle and truck trips, respectively. The total project trip assignment (in PCE) is provided as Figure 5.

Level of Service Analysis

Per the County's TIS guidelines, an LOS analysis would be required at intersections (of Collector or higher designated streets) where projects would generate 50 or more peak hour trips. As such, the following intersection and roadway segments were selected for analysis:

Intersections

1. Lenwood Road/SR-58 WB Ramps
2. Lenwood Road/SR-58 EB Ramps
3. Lenwood Road/Community Boulevard
4. Lenwood Road/Agate Road
5. Lenwood Road/Jasper Road
6. Lenwood Road/Main Street
7. Commerce Parkway/Lenwood Road
8. I-15 SB Ramps/Lenwood Road
9. I-15 NB Ramps - High Point Parkway/Lenwood Road
10. SR-58 SB Ramps/Main Street
11. SR-58 NB Ramps/Main Street

Study Roadway Segments

1. Lenwood Road, south of Agate Road
2. Lenwood Road, north of Cam Del Sol

Analysis Scenarios

The intersection LOS analyses will be prepared for the weekday AM and PM peak hours at the study area intersections listed above for the following analysis scenarios:

- Existing conditions
- Background conditions (no Project) –Defined as Opening Year Conditions with ambient growth and traffic from approved projects
- Background conditions plus Project - Defined as background conditions plus traffic from the proposed project
- Cumulative Year (no project) - Defined as ambient growth to the Cumulative Horizon plus traffic approved and pending projects in the area
- Cumulative Year plus project - Defined as Cumulative No Project Conditions plus traffic from the proposed Project.

Project Opening Year baseline conditions will be developed from a "build-up" method based on the application of cumulative project trip generation estimates and an ambient growth rate (1%), added to the existing traffic volumes. The growth rate is based on the growth rate identified for the Desert region in the County's Transportation Scoping form (Attachment E). Trip generation estimates for cumulative projects in the Opening Year condition will be based on trip rates in ITE's Trip Generation, 11th Edition, or from their respective traffic studies and/or CEQA documents

(if available). Dudek will obtain a list of cumulative projects from the City of Barstow Planning Department and the County of San Bernardino Planning Division.

Horizon Year (2040) traffic volumes will be obtained from the SBCTA's San Bernardino Transportation Analysis Model (SBTAM). Baseline and Plus Project traffic volumes from SBTAM will be post-processed to model specifications.

LOS analyses will be prepared consistent with County's requirements which is based on the Highway Capacity Manual (HCM) methodology. The operational analysis will be conducted using Synchro/SimTraffic analysis software to reflect the effect of downstream congestion more accurately on intersection operations. In addition, queues will be determined at key storage (turn) lanes.

Traffic Counts

New AM and PM peak hour and daily roadways traffic counts were collected at the study area intersections and roadways on May 11, 2023 during a non-holiday week while adjacent schools were in session.

Vehicle Miles Traveled Screening Analysis and Approach

Consistent with the screening thresholds identified in the County Guidelines, the SBCTA VMT Screening Tool was used to aid in the VMT screening process. The County Guidelines state that a project may have a less than significant impact and screen out of requiring a project-level VMT analysis if it meets at least one of the County's following VMT screening criteria:

- Local Serving Project Screening
- Projects Generating Less than 110 Daily Vehicle Trips
- Transit Priority Area (TPA) Screening
- Low VMT Area Screening

Local Serving Project Screening

The County Guidelines suggest Local-Serving Retail under 50,000 square feet and Local Essential Services such as K-12 schools, day care centers, and community institutions shortens nondiscretionary trips by putting those goods and services closer to residents, resulting in an overall reduction in VMT.

The Project includes amenities that cater to both local residents and motorists traveling along Lenwood Road, I-15, and SR-58. It includes EV charging facilities that will primarily serve vehicles already using the adjacent freeways. This component, although not strictly local-serving in nature, does not generate additional trips that were not already occurring. By offering dining, retail/convenience shopping, and EV charging opportunities, the Project is expected to shorten vehicle trips for both local residents and passing motorists. Thus, the Project's EV charging and retail components qualify for exemption from a VMT assessment under the County Guidelines. Therefore, the Local Serving Project screening criteria is partially met for the EV charging station and commercial building.

Projects Generating Less Than 110 Daily Vehicle Trips

The County Guidelines state projects generating less than 110 daily vehicles trips are presumed to have a less than significant impact on VMT. As previously discussed, the Project is forecast to generate 5,580 daily trips and is above the 110 daily trip threshold. Therefore, this criterion is not met.

Transit Priority Area (TPA) Screening

The County Guidelines state that projects located within a TPA (i.e., within ½ mile of an existing "major transit stop" or an existing stop along a "high-quality transit corridor") may be presumed to have a less-than-significant impact absent substantial evidence to the contrary. Based on the Screening Tool results presented in Attachment C, the project site is not located within ½ mile of an existing major transit stop, or along a high-quality transit corridor. Therefore, the TPA screening criteria is not met.

Low VMT Area Screening

As noted in the County Guidelines, "development in efficient areas of the County will reduce VMT per person/employee and is beneficial to the region". The County Guidelines state that projects with VMT per person/employee lower than 4% below the existing VMT per person for the unincorporated County are considered to have a less-than-significant VMT impact.

It is general industry practice to perform a secondary evaluation to identify if a project is consistent with the existing land use within that traffic analysis zone or Transportation Analysis Zone (TAZ) and use professional judgement that there is nothing unique about the project that would otherwise be mis-represented using data from the travel demand model. Existing land use information was examined in the SBTAM model for the project's TAZ 53962201 and was found to contain land use information that would be inconsistent with the project. Therefore, the project does not qualify for this screening criteria.

The project's EV charging station and commercial component was found to meet the Local Serving Project screening criteria. However, the remaining industrial component of the project does not meet eligible screening criteria. Therefore, a project-level VMT analysis will be prepared, as further described below.

VMT Analysis Approach

Dudek will prepare a project-level VMT analysis consistent with the County's requirements and the Governor's Office of Planning and Research's (OPR) Technical Advisory on Evaluating Transportation Impacts in CEQA (December 2018). The Project's VMT and the forecast regional VMT will be calculated using the SBTAM. Dudek will contract with the transportation firm authorized to run the model. The traffic analysis zone or TAZ of the Project site will be modified with the Project's proposed land uses, and a Select Zone model run will be performed to determine the Project's trip assignment. As part of the Select Zone run, the VMT estimate of the Project's TAZ will be determined. Then, the regional VMT estimate for the study area region (extent to be determined by the County) will also be provided from SBTAM. VMT estimates will be analyzed for the Baseline plus Project and Cumulative plus Project conditions.

If VMT impacts are identified, Dudek will coordinate with the County to determine the appropriate VMT reduction strategies provided in their VMT guidelines, and other resources noted in the OPR and Caltrans Technical Advisories (or other approved sources) to mitigate Project impacts.

Access, Circulation, and Safety

Dudek will qualitatively analyze the transit, pedestrian, and bicycle facilities that serve the project site. Project access and on-site circulation will be based on the County's Standard Plans/Drawings for access and on-site circulation design requirements. Vehicular queuing at the project's driveways will be analyzed for adequacy based on the 95th percentile (design) queues. For any significant project traffic impacts found, Dudek will determine appropriate and feasible mitigation measures to offset significant project impacts.

City of Barstow Traffic Scoping Comments (via email)

From: Matthew Summers <msummers@chwlaw.us>
Sent: Tuesday, March 18, 2025 10:11 PM
To: Phil Angelides (RCI); Rochelle Clayton; Chris Heldreth; Mark D. Rowan; Mark Teague; Colin Drukker; Carmen A. Brock
Cc: bvail river-west.com; Greg Devereaux; David Mlynarski; Jamie Durrell; Maria Oba Minassian; Brad S. Merrell; Harry, Jennifer; amrit@meyersnave.com; Lindgren, Adam; Adam N. Mentzer
Subject: RE: Upcoming meeting - 3/19/25 1:00 pm - 2:30

Thank you Phil, and all. For tomorrow's meeting re the Lenwood EV Charging and Logistics Project – below is an agenda and attached are the City's comments on the traffic scoping memo and a proposed City costs reimbursement agreement for review.

Lenwood EV Warehouse Project Meeting 3/19/25 Agenda

1) Introductions -

-New Barstow City Manager Rochelle Clayton

2) BIG Project Timeline Overview

-Goal for Draft EIR Release – End of 2025

3) Application Processing Costs and Plan

-Timing and plan for Lenwood Project and County application process, including EIR

-Timing and plan for processing application to City for extra-territorial sewer service legislative City Council approval – including City application and processing fees

-City processing costs include: sewer needs analysis, traffic analyses, staff and consultant time

-See attached draft application processing costs reimbursement agreement

-Timing and plan for processing application to LAFCO for extra-territorial sewer service approval

4) Traffic Analyses and Road and Sewer Infrastructure Costs/Improvements

-For traffic scoping agreement comments – review and discussion of attached comments from David Evans & Associates & Fehr and Peers – City traffic consultants & from Kimley-Horn – BNSF Planning Consultant. In the scoping agreement "Level of Service Analysis" section, please also add the following intersections to list of intersections to be analyzed:

- Lenwood Road/Sun Valley Drive
- Lenwood Road/Love's Travel Strop Driveway
- Lenwood Road/High Desert Road
- Lenwood Road/Chevron Driveway

-Discussion of timing/plan for sharing trip generation figures for BIG and Lenwood Project

-Discussion re Lenwood Project payment for fair share of infrastructure costs, including needed roadway and circulation system improvements and sewer infrastructure and connection costs.

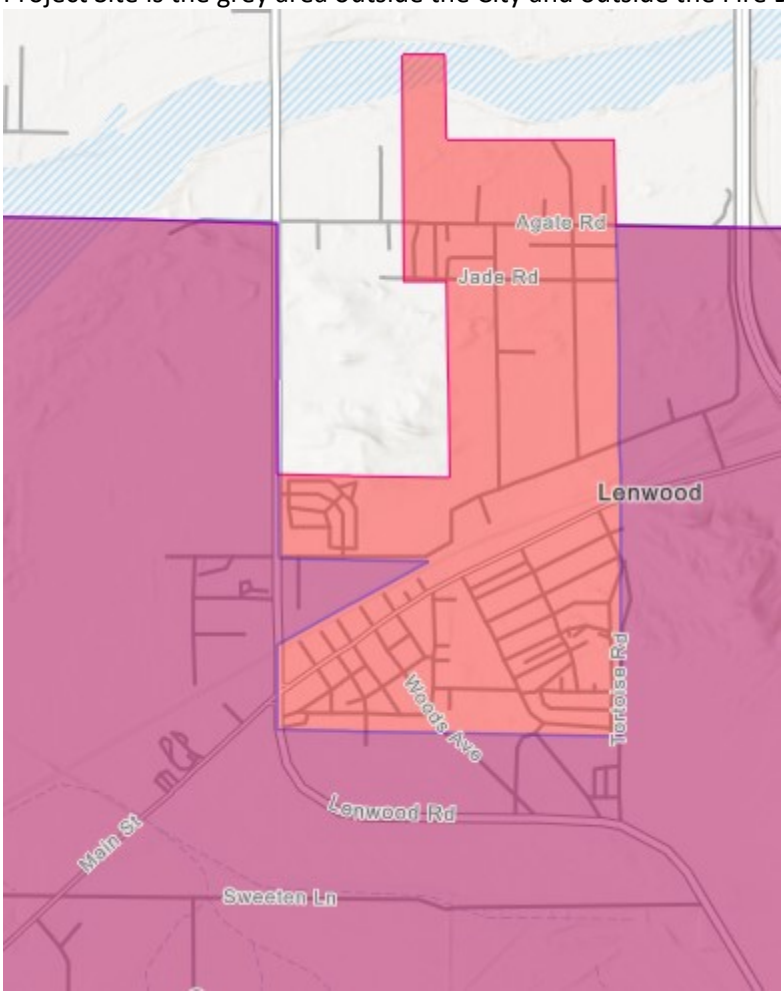
5) Fire Service Plan

-Is the plan to have County Fire service this facility, or annex into the Barstow Fire Protection District? See Map.

6) Opportunities for Synergy between BIG and Lenwood EV Project

7) Next Steps and Next Meeting

Fire Service Question: Barstow City and Barstow Fire Protection District Map – Purple is City and Red is Fire District. Project Site is the grey area outside the City and outside the Fire District, in the center of the snip below.



Meeting Participants:

City:

Rochelle Clayton, City Manager
Chris Heldreth, Community Development Director
Mark Rowan, City Engineer's Office
Robert Kilpatrick, City Traffic Consultant
Mark Teague, Placeworks, City Planning Consultant
Colin Drukker, Placeworks, City Planning Consultant
Matthew Summers, Colantuono, Highsmith & Whatley, PC, City Attorney
Carmen Brock, Colantuono, Highsmith & Whatley, PC, City CEQA Counsel

County:

Jon Braginton, Land Use Services
Vanessa Norwood, Land Use Services

BNSF:
Jennifer Harry, Kimley Horn, BNSF Planning Consultant
Amrit Kulkarni, Meyers Nave, BNSF Land Use Counsel
Adam Lindgren, Meyers Nave, BNSF Land Use Counsel

As the City stated in our prior meeting, and in my prior letter, the City is not opposed to this EV charging and logistics project, and of course cannot yet express support for the project given the lack of completed environmental impacts review. The City recognizes the value to the community of the proposed electric vehicle charging station and looks forward to the jobs that a new logistics facility would create. The City also appreciates the commitment by EVC Partners LLC to cover its fair share of infrastructure costs, including needed roadway and circulation system improvements and sewer infrastructure and connection costs spurred by the project, all as part of the potential legislative approval. We look forward to tomorrow's meeting.

Thank you,
-Matt

MEMORANDUM

To:	City of Barstow - Rochelle Clayton, City Manager; Matthew Summers, City Attorney; Chris Heldreth, Community Development Department Director
From:	Lisa Valdez, Senior Transportation Planner
Subject:	Electrical Vehicle Charging Station and Logistics Facility Project, Lenwood, San Bernardino County, Transportation Scoping Response to Comments
Date:	April 4, 2025
cc:	Vanessa Norwood, Contract Planning Manager, County of San Bernardino Land Use Services; Jon Braginton, Planner, County of San Bernardino Land Use Services; Phil Angelides, EVC Partners LLC; Brian Vail, EVC Partners; Greg Devereaux, Worthington Partners; David Mlynarski, Transtech

This memorandum summarizes our response to comments on the Transportation Scoping memorandum (Scoping Memo) comments provided by David Evans and Associates dated February 7, 2025 (Attachment D of Scoping Memo), Fehrs and Peers dated March 7, 2025 (Attachment E of Scoping Memo), and email correspondence provided by the City of Barstow on March 18, 2025 (Attachment F of Scoping Memo). This memorandum has been prepared in support of the revised Scoping Memo provided to the City of Barstow and County of San Bernardino on April 4, 2025, and is also included as Attachment G of the Scoping Memo. Figures and tables referenced below are provided in the revised Scoping Memo.

David Evans & Associates Comments

1. **Project Description:** Table 1 has been added to the Scoping memo summarizing the proposed land uses and square footages.

2. **Project Site Plan:** The preliminary project site plan, including the site access, has been reviewed and approved by the County of San Bernardino Fire Department, Public Works Department, and Planning Department. The driveway spacing meets the County's minimum driveway spacing requirements. Furthermore, a detailed site access and queuing analysis will be prepared to access any potential access issues as part of the Transportation Impact Study (TIS). The analysis will be based on the County's Standard Plans/Drawings for access and on-site circulation design requirements.

3. **Project Site Access and On-Site Circulation:** The project frontage improvements will be constructed to meet the ultimate half-width for a Major Highway. Additional detail has been provided in the Proposed Frontage improvements discussion of the Scoping memo. Figure 7, Proposed Lenwood Road Section, is also provided as an attachment.

4. **Trip Generation Rates**

    a. The truck wash and truck maintenance services are ancillary uses and are not anticipated to generate additional traffic. A footnote has been added to the trip generation table noting this assumption.

b. The AM peak hour trips have been updated to represent 6% of the daily traffic as noted in the trip generation table assumptions. The trips were incorrectly calculated based on 7%. This error has been fixed.
c. The AM peak hours trips have been updated, and the remaining trips have been verified. No other changes are required.
d. The AM peak hour PCE trips have been updated based on the revision noted in response 4b.

5. **Trip Distribution**
   a. The PM peak hour entering volumes have been verified and are presented in Figure 6.
   b. The trip volumes have been balanced between the driveways and are presented in Figure 6.

6. **Traffic Study Scenarios**
   a. Comment noted. The Opening Year to be analyzed is anticipated to be 2027 and will be finalized once the traffic study has been initiated.
   b. As indicated in the Scoping memo, the ambient growth rate is based on the County's TIS Guidelines and the Traffic scoping form which states that projects in the Desert Region should use an ambient growth rate per year of 1%.

7. **Traffic Volumes**
   a. The 2023 traffic volumes will be updated to 2025 conditions by applying a 1% growth rate.

Fehr & Peers Comments

1. **Flatten Attachments:** As requested, the attachments have been flattened.
2. **Study Roadway Segments:** Segment 2 has been updated to *"south"* of Cam Del Sol. This was a typo in the memo.
3. **BIG Project**: The BIG project will be included in the Opening Year analysis.
4. **AM peak hour trips.** The AM peak hour trips have been updated to represent 6% of the daily traffic as noted in the trip generation table assumptions. The trips were incorrectly calculated based on 7%. This error has been fixed.
5. **Rounding Errors**. The trip generation table has been manually updated to minimize rounding errors.

City of Barstow Comments (provided via email on March 18, 2025)

1. **Study Intersections:** Please also add the following intersections to list of intersections to be analyzed:

   - Lenwood Road/Sun Valley Drive
   - Lenwood Road/Love's Travel Strop Driveway
   - Lenwood Road/High Desert Road
   - Lenwood Road/Chevron Driveway

   The intersections above will be included in the TIS.

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you can confirm the sender and know the content is safe.

Osvaldo,

The EV charging station project has been slightly modified since we last spoke and as a result the project trip generation estimates have been revised. Please see the attached spreadsheet and new site plan.

- The project is no longer proposing alternative fueling stations.
- The truck stop rate has been removed since this rate was previously used to account for the alternative fuels.
- To account for the commercial land uses (15,000 SF total), the strip retail rate has been applied to 12,000 SF and the fast-food rate with drive-through has been applied to 3,000 SF.
- Based on the ITE rates, 3,000 SF is the average size of a fast-food restaurant with drive-through.
- No other changes to the trip rates or assumptions were made.

Please let us know if these changes are acceptable. Additionally, we would like to get the County's initial feedback on the access proposed for the parking lot along the east edge of the site. The parking lot is for passenger vehicles only and would be accessed from the four drive aisles located along the truck parking and loading docks. A future road is identified at the northeast corner of the site which would ultimately provide a secondary access to Agate Road to the north. Please let us know if there are any issues with the access as currently proposed.

Thank you,

Lisa Valdez (She/Her)

Lisa,

Thank you for the updated scoping agreement. As previously noted, the report will need to be circulated and approved by Caltrans and the City of Barstow. It's recommended you also get their approval for this scoping agreement before commencing work and/or ordering traffic counts. Aside from this, Traffic has no further comments.

Respectfully,

Osvaldo,

Thank you again for meeting with us this morning to discuss the revised project trip estimates. Per our discussion, we updated the PM peak hour trip percentage to 7% for the alternative fuels and auto and truck chargers, consistent with the Truck Stop rate. We had discussed using 6%, but the calculated rate is 6.9%. The revised table is attached.

Please confirm that with this update, our scoping is approved, and we can start the analysis.

Thanks,

Lisa Valdez

Good morning,

Thank you for providing further direction on the approach to the trip generation estimates. We will send you the updated table for your review prior to starting our analysis. We'd also like to schedule another call to walk through the revised table once its ready.

Thanks,

Lisa Valdez
Senior Transportation Planner

Subject: RE: TRSTY-2023-00007 (PROJ-2023-00018)- Lenwood Scoping Agreement Comments

Good morning Lisa,

It was a pleasure speaking yesterday regarding the truck fueling and warehouse project in Lenwood. We have taken a second look into the project scope and trip generation estimates per your request. Our findings are that the overall project consists of definable land uses matching ITE categories and it would be most appropriate to aggregate trips for each category instead of calculating trips for each component. As an example, the development proposes to build a diesel canopy with 12 vehicle fuel positions and several alternative fuel options. While we acknowledge that ITE does not have trip generation data for alternative fueling stations, the proposed diesel pumps combined with the retail/restaurant/bathroom facility would fit land use code 950 for a truck stop. Thus, the scoping should develop the trip generation based on this land use and add the trips for the proposed warehouse and the alternative fueling stations. As discussed, there may be room for trip internalization (pass-by, diverted link, and internal capture) which may be analyzed in the project's traffic study. I hope this information was useful, but please feel free to contact me if you have further questions.

Respectfully,

Osvaldo Roque, P.E.

Hi Eric,

Thank you for providing the comments on the Scoping Agreement. I'd like to set-up a call with the County to walk through the comments, particularly the Trip Generation rates. It should be brief! I can meet during the following times:

- Thursday (10/26)- 10 AM to 1 PM
- Friday (10/27)- 9 AM to 11 AM and 1 PM to 2:30 PM
- Monday (10/30)- 9 AM to 2:30 PM

Please let me know if any of these times work and I will set up a call.

Thanks,

Lisa Valdez
Senior Transportation Planner

Original Approved Scoping Memo to County, November 2023

DUDEK
MAIN OFFICE
605 THIRD STREET
ENCINITAS, CALIFORNIA 92024
T 800.450.1818 F 760.632.0164

MEMORANDUM

To:	Jeremy Johnson, Engineering Manager, San Bernardino County Public Works Department
From:	Lisa Valdez, Senior Transportation Planner
Subject:	Lenwood EV Charging/Low Carbon Fuels Auto/Truck Stop and Distribution Center Project
Date:	November 16, 2023
cc:	Phil Angelides, EVC Partners LLC
Attachment(s):	County Transportation Scoping Form
	Table 1: Project Trip Generation table
	Figures 1-4

Dudek has prepared the following transportation scoping memorandum for the proposed Lenwood EV Charging Truck Stop and Distribution Center Project (project) to be located on Lenwood Road between California Highway 58 (CA 58) and Interstate 15 (I-15), in the County of San Bernardino (Figure 1, Project Location). This memo describes the anticipated trip generation and trip distribution of the proposed project and provides the proposed analysis methodology for the Transportation Impact Study (TIS) based on the requirements and policies from the San Bernardino County's (County) Transportation Impact Study Guidelines (July 2019), the San Bernardino County Transportation Authority's (SBCTA) Congestion Management Program (CMP), the City of Barstow Circulation Element (2015), and Caltrans Transportation Impact Study Guide (May 2020). The County's Traffic scoping form is also provided as an attachment to this memo.

Project Description

The approximately 100-acre Project site includes four parcels (049-714-203, 049-714-204, 049-714-214, and 049-714-215) and is located on Lenwood Road between CA 58 and Interstate-15, approximately one mile west of CA 58 and four miles west of downtown Barstow. The Project site is undeveloped and surrounded by undeveloped lands with the exception of a single-family residential neighborhood, High Desert Estates located adjacent to the southern Project boundary. The Project is proposing development on approximately 20-acres in the southern portion of the site with an electric vehicle charging hub for medium and heavy-duty trucks and light duty vehicles, including other clean energy fuels (e.g., R-CNG, renewable diesel, hydrogen [all included in the CA Low Carbon Fuel Standard program/funding, etc.]), battery storage, and a 15,000 square foot (SF) commercial building to provide food and other amenities (e.g., showers and rest areas) as trucks and cars are charging/fueling. Access would be provided from Lenwood Road. The remaining site is proposed to include three warehouse buildings of 447,144 SF each, for a total of 1,341,432 SF of light industrial warehouse, logistic, and distribution facilities.

Trip Generation

The estimated project trip generation is summarized in Table 1 (attached). Trip generation estimates for the proposed commercial and warehouse uses are based on daily and AM and PM peak hour trip generation rates obtained from the Institute of Transportation Engineers (ITE) Trip Generation Handbook, 11th Edition (2021). Since there are no industry standard rates for EV charging stations, trip rates for the charging station (by charging/fuel

type) are based on assumptions regarding the maximum charging capacity, utilization rates, and other anticipated site operations. The assumptions are outlined in detail in the trip generation table notes.

Additionally, Passenger car equivalent (PCE) factors were applied to the trip generation estimates to account for truck traffic. The San Bernardino County Congestion Management Plan (CMP) indicates that projects with high truck percentages should convert project trips to PCE. A 1.5 PCE factor was applied to 2-axle trucks, 2.0 PCE for 3-axle trucks, and a 3.0 PCE factor was applied to 4-axle trucks per the San Bernardino County CMP. As the ITE Trip Generation Handbook does not provide a breakdown of truck traffic by axle classification, vehicle mix data and percentages are also applied to the project trip generation estimates from the 2014 SCAQMD Warehouse Truck Trip Study Data Results and Usage (SCAQMD Study).

As shown in the Table 1, with the internal trip reduction applied, the project would generate 6,573 daily trips, 435 AM peak hour trips, and 480 PM peak hour trips. This is equivalent to 12,418 daily PCEs, 897 AM peak hour PCEs, and 989 PM peak hour PCEs.

Trip Distribution

Project trip distribution percentages are based on logical travel paths to and from the project site to major highway corridors and the City's designated truck routes. The preliminary project trip distribution percentages are shown in Figures 3 and 4, for passenger vehicle and truck trips, respectively. The project trip assignment through the study intersections will be provided once the distribution has been approved.

Level of Service Analysis

Per the County's TIS guidelines, an LOS analysis would be required at intersections (of Collector or higher designated streets) where projects would generate 50 or more peak hour trips. As such, the following intersection and roadway segments were selected for analysis:

Intersections

1. Lenwood Road/ SR-58 WB Ramps
2. Lenwood Road SR-58 EB Ramps
3. Lenwood Road/Community Boulevard
4. Lenwood Road/Agate Road
5. Lenwood Road/Jasper Road
6. Lenwood Road/Main Street
7. Commerce Parkway/Lenwood Road
8. I-15 SB Ramps/Lenwood Road
9. I-15 NB Ramps - High Point Parkway/Lenwood Road
10. SR-58 SB Ramps/Main Street
11. SR-58 NB Ramps/Main Street

Study Roadway Segments

1. Lenwood Road, south of Agate Road
2. Lenwood Road, north of Cam Del Sol

Analysis Scenarios

The intersection LOS analyses will be prepared for the weekday AM and PM peak hours at the study area intersections listed above for the following analysis scenarios:

- Existing conditions
- Background conditions (no Project) –Defined as Opening Year Conditions with ambient growth and traffic from approved projects
- Background conditions plus Project - Defined as background conditions plus traffic from the proposed project
- Cumulative Year (no project) - Defined as ambient growth to the Cumulative Horizon plus traffic approved and pending projects in the area
- Cumulative Year plus project - Defined as Cumulative No Project Conditions plus traffic from the proposed Project.

Project Opening Year baseline conditions will be developed from a "build-up" method based on the application of cumulative project trip generation estimates and an ambient growth rate (1%), added to the existing traffic volumes. Trip generation estimates for cumulative projects in the Opening Year condition will be based on trip rates in ITE's Trip Generation, 11th Edition, or from their respective traffic studies and/or CEQA documents (if available). Dudek will obtain a list of cumulative projects from the City of Barstow Planning Department and the County of San Bernardino Planning Division.

Horizon Year (2040) traffic volumes will be obtained from the SBCTA's San Bernardino Transportation Analysis Model. Baseline and Plus Project traffic volumes from SBTAM will be post-processed to model specifications.

LOS analyses will be prepared consistent with County's requirements which is based on the Highway Capacity Manual (HCM) methodology. The operational analysis will be conducted using Synchro/SimTraffic analysis software to reflect the effect of downstream congestion more accurately on intersection operations. In addition, queues will be determined at key storage (turn) lanes, including at the I-15 and SR-58 off-ramps.

Traffic Counts

New AM and PM peak hour and daily roadways traffic counts were collected at the study area intersections and roadways on May 11, 2023 during a non-holiday week while adjacent schools were in session. Additional counts were collected at the intersection of Lenwood Road and Jasper Road on November 16, 2023.

Vehicle Miles Traveled

Dudek will prepare a project-level VMT consistent with the County's requirements and the Governor's Office of Planning and Research's (OPR) Technical Advisory on Evaluating Transportation Impacts in CEQA (December 2018).

The Project's VMT and the forecast regional VMT will be calculated using the San Bernardino Transportation Analysis Model (SBTAM). Dudek will contract with the transportation firm authorized to run the model. The traffic analysis zone or TAZ of the Project site will be modified with the Project's proposed land uses, and a Select Zone model run will be performed to determine the Project's trip assignment. As part of the Select Zone run, the VMT estimate of the Project's TAZ will be determined. Then, the regional VMT estimate for the study area region (extent to be determined by the County) will also be provided from SBTAM. VMT estimates will be analyzed for the Baseline plus Project and Cumulative plus Project conditions.

If VMT impacts are identified, Dudek will coordinate with the County to determine the appropriate VMT reduction strategies provided in their VMT guidelines, and other resources noted in the OPR and Caltrans Technical Advisories (or other approved sources) to mitigate Project impacts.

Access, Circulation, and Safety

Dudek will qualitatively analyze the transit, pedestrian, and bicycle facilities that serve the project site. Project access and on-site circulation will be based on the County's Standard Plans/Drawings for access and on-site circulation design requirements. Vehicular queuing at the project's driveways will be analyzed for adequacy based on the 95th percentile (design) queues. For any significant project traffic impacts found, Dudek will determine appropriate and feasible mitigation measures to offset significant project impacts.

Firm Preparing Study

11/16/2023

DATE

SCOPE FOR TRAFFIC STUDY

Project Name:	Lenwood EV Charging/Low Carbon Fuels Auto/Truck Stop and Distribution Center Project

Engineer of Record _____ **License Number** _____

1. Traffic Distribution: Please insert or attach Figure(s) illustrating project trip distribution in percentages and volumes at the study intersections analyzed. See attached.

2. Trip Credit: Exact amount of credit subject to approval by Traffic Division.

Transportation Demand Management (TDM)	Yes/no	No
Existing Active Land Use	Yes/no	No
Previous Land Use	Yes/no	No; vacant land
Internal Trip Reduction	Yes/no	Yes
Pass-by Trip Reduction	Yes/no	No

3. Related Projects: Consultant should check with Planning in the San Bernardino County Department of Land Use Services and planning departments of adjoining Cities. Documentation of the consultation from these agencies shall be included in the traffic study. Related projects list shall be submitted to Traffic Division for our review and approval before being incorporated in the study.

4. Freeway Analysis: The potential traffic impact on the following Freeway(s) must be considered.

Highway 58 and Interstate-15

The applicant shall consult with the State of California Department of Transportation (Caltrans) to determine the California Environmental Quality Act levels of significance with regard to traffic impacts on Caltrans' freeway facilities. This consultation shall also include a determination of Caltrans requirements for the study of traffic impacts to its facilities and the mitigation of any such impacts. This analysis must follow the most current Caltrans' Vehicle Miles Traveled-Focused Transportation Impact Study Guide (May 2020) and can be obtained from https://dot.ca.gov/-/media/dot-media/programs/transportation-planning/documents/sb-743/2020-05-20-approved-vmt-focused-tisg-a11y.pdf. If Caltrans finds that the project has a significant impact on the freeway, Caltrans shall be requested to include the basis for this finding in their response. If fees are proposed to mitigate the freeway impact, Caltrans shall be requested to identify the specific project to which the fees will apply. These written comments from Caltrans shall be included with the traffic study and submitted to Public Works for review and approval. If a documented good faith effort is made to consult with Caltrans and written comments cannot be obtained from within a reasonable amount of time, an analysis of the freeway impact shall be made using HCM procedures. Appendix A of the San Bernardino County Transportation Authority CMP outlines allowable modifications to these procedures. The San Bernardino County Transportation Authority CMP can be viewed online at: https://www.gosbcta.com/planning-sustainability/?term=249

SCOPE FOR TRAFFIC STUDY

Project Name:	Lenwood EV Charging/Low Carbon Fuels Auto/Truck Stop and Distribution Center Project

5. Trip Generation-

See Table 1 (attached)

Trip Generation Rate(s) Source: ITE Trip Generation		**I – Institute of Transportation Engineers; S – San Diego Traffic Generators; C – County; O – Other:**													
Land Use Code	**Land Use**	**Rate Based on**	**QTY**	**AVTE Units***	**Daily Trips**	Weekday A.M. Peak			Weekday P.M. Peak			Weekend peak hour			**Edition:** 11th
						In	Out	Total	In	Out	Total	In	Out	Total	

* - Average Vehicle Trip Ends.
For ITE Land Uses provide number and name of Land Use. e.g. LU 814 - Variety Store. Units include ksf, employee, GLA, etc.

SCOPE FOR TRAFFIC STUDY

Project Name:	Lenwood EV Charging/Low Carbon Fuels Auto/Truck Stop and Distribution Center Project

6. Study Intersections: At minimum, the study shall include the following intersections. The list is subject to change after related projects, trip generation and distribution are determined. Consultant should check with adjoining Cities regarding their requirements in addition to the following County/City intersections. Documentation of the consultation from these agencies shall be included in the traffic study.

Xtn #	% County	% City	N-S/E-W Street Name	City Name/Caltrans	Signalized	CMP
1	100%		Lenwood Road/ SR-58 WB Ramps	County/Caltrans	No	Yes

9		100%	I-15 NB Ramps - High Point Parkway/Lenwood Road	Barstow/Caltrans	Yes	Yes
10		100%	SR-58 SB Ramps/Main Street	Barstow/Caltrans	Yes	Yes
11		100%	SR-58 NB Ramps/Main Street	Barstow/Caltrans	Yes	Yes

Cities/agencies to be consulted: City of Barstow; Caltrans

SCOPE FOR TRAFFIC STUDY

Project Name:	

7. Other:

Traffic counts may be conducted immediately per the following:
• Must be taken on Tuesdays, Wednesdays or Thursdays. • Certain projects may need to collect traffic counts on Friday or Sunday
• Must exclude holidays, and the first weekdays before and after the holiday.
• Must be taken on days when local schools or colleges are in session.
• Must be taken on days of good weather, and avoid atypical conditions (e.g., road construction, detours, or major traffic incidents).
• Traffic counts used for other traffic studies in the area shall **NOT** be reused again, unless 25% of the counts conducted for that particular traffic study are validated with new counts. The difference in volumes between the old and new counts at each corresponding movement should not be more than 10%.
• New traffic counts shall be checked to ensure the difference in volumes at corresponding approaches, if applicable, between two adjacent intersections is no more than 10% unless the difference can be justified.
• For all proposed mitigation measures, a conceptual plan for the improvements shall be submitted to our Traffic Studies section for review and approval prior to the approval of the Traffic Impact Analysis. All proposed improvements shall be within the right-of-way.
• For all cumulative mitigation measures, a cost estimate for the improvement shall be submitted.
• Raw traffic counts data must be included with traffic analysis study
• Traffic Counts must not be older than 1 year prior to submittal unless approved by County Traffic.

This analysis must follow the most current Traffic Impact Study Guidelines for the County as stated in the County's Road Planning and Design Standards.

8. Fees

The County charges on an actual cost basis for review of traffic studies. An initial deposit of $1,802 is required at the time that a land use application is filed with the Department of Land Use Services If the review costs exceed the initial deposit, the applicant will be expected to provide additional funds and the review will be suspended until the additional funds are deposited.

Project Name:	

9. Contact Information:

Please submit a signed copy of this scope for approval by the Traffic Division. Draft scopes may be sent electronically. Final scope with signature should be submitted in person or by US Mail to:

[7]Charging Station Assumptions:

EV Charging Truck Stop and Distribution Center Project Trip Generation Summary

Assumptions for the EV Charging/Low Carbon Fuels Auto/Truck Stop

R-CNG- 4 lanes (8 pumps)					
Trucks per hour per pump	3.5				
Pumps used at one time	4				
Total Trucks per hour	14				
Max trucks per day	336				
Average Utilization	24%	https://www.upside.com/blog/why-measuring-capacity-utilization-is-essential-for-fuel-retailers			
Average Daily Trucks	80.64	161.28	daily trips	16.128	daily rate per pump
AM Peak, equal split, 6% of daily total occurs during AM peak	6%				
PM Peak, equal split, assumes 7% of daily total occurs during PM peak	7%				

Hydrogen- 4 pumps					
Trucks per hour per pump	4.3				
Pumps used at one time	4				
Total Trucks per hour	17.2				
Max trucks per day	412.8				
Average Utilization	24%	https://www.upside.com/blog/why-measuring-capacity-utilization-is-essential-for-fuel-retailers			
Average Daily Trucks	99.07	198.14	daily trips	99.07	daily rate per pump
AM Peak, equal split, 6% of daily total occurs during AM peak	6%				
PM Peak, equal split, assumes 7% of daily total occurs during PM peak	7%				
Conservative estimate, trips could be as few as 2-3 per week					

EV Autos- 8 DC Fast chargers			
Count	8		
Max rate (kw)	250		
Avg Battery Capacity (kWh)	75		
Avg Amount Charged	70%		
kWh Charged / Visit	52.5		
Fast Charger Dwell Time (hrs)	0.21		
Theoretical Max (auto/hr)	38.10		
Theoretical Maximum (vehicle/day)	914.29		
Average Utilization	24%	https://www.upside.com/blog/why-measuring-capacity-utilization-is-essential-for-fuel-retailers	
Average vehicles per day	219.43	438.86	daily trips
AM Peak, equal split, 6% of daily total occurs during AM peak	6%		
PM Peak, equal split, assumes 7% of daily total occurs during PM peak	7%		

EV Trucks- 30 DC Fast chargers (slower) + 15 DC Fast chargers			
See EV Charging Calculator tab for details	LD Trucks	MD Trucks	HD Trucks
Total Theoretical Max / Hour	102.9	51.4	21.4
Theoretical Maximum (vehicle/day)	2469.6	1233.6	513.6
Average Utilization	40%	40%	40%

EV Charging Truck Stop and Distribution Center Project Trip Generation Summary

Utilization Rate Avg Vehicle/Day	987.8	493.4	205.4	1686.7	
Percent of Truck Traffic (same as warehouse vehicle mix)	40.0%	10.0%	50.0%		
Vehicles/Day Based on % of Traffic	132	33	164	329	daily trips
Average Daily Trucks	263	66	329	658	daily trips
AM Peak, equal split, 6% of daily total occurs during AM peak	6%				
PM Peak, equal split, assumes 7% of daily total occurs during PM peak	7%

PER 2022 CBC TABLE 11B-208.2: 401 TO 500 STALLS, 9 STALLS REQUIRED TO BE ACCESSIBLE STALLS. EVERY 6 OR FRACTION OF SIX, AT LEAST ONE SHALL BE VAN PARKING.
9 ADA STALLS (INCLUDING 2 VAN ACCESSIBLE STALLS) PROVIDED.

PER 2019 CALIFORNIA GREEN BUILDING CODE TABLE 6.106.5.3.1: OVER 201 STALLS, 20% OF TOTAL REQUIRED TO BE EV CAPABLE SPACES. 430 X 0.2 = 84. OF THESE, 20% ARE TO BE PROVIDED WITH EVSE. 84 X 0.20 = 21. 84 EV STALLS PROVIDED AND 22 TO HAVE EVSE INSTALLED

PER CBC TABLE 11B-228.3.2.1, 76 TO 100 EVCS STALLS: 1 VAN ACCESSIBLE EVCS, 1 STANDARD ACCESSIBLE EVCS AND 3 AMBULATORY EVCS ARE REQUIRED.
OF THE 22 EVCS REQUIRED, 1 VAN EVCS, 1 STANDARD ADA EVCS, AND 3 AMBULATORY EVCS ARE PROVIDED AS SHOWN.

KEYNOTES:

1. EXISTING PROPERTY LINES
2. PROPOSED NEW PARCEL LINES
3. TYPICAL LANDSCAPE AREAS
4. TYPICAL BIO--RETENTION AREA
5. PROPOSED LOCATION OF NEW SITE ACCESS DRIVE CURB CUT
6. TYPICAL DRIVE ISLE
7. TYPICAL PARKING:
   A. STANDARD STALLS: 9' X 19' OR 9' X 17' WITH 2' PARKING OVERHANG.
   B. COMPACT STALLS: 8' X 18' OR 8' X 14' WITH 2' PARKING OVERHANG (33% MAX).
   C. ACCESSIBLE PARKING STALLS: 9' X 18' MIN. WITH 2' PARKING OVERHANG WITH 5' OR 8' WIDE LOADING ZONE
   D. ELECTRIC VEHICLE CHARGING SPACES (STALLS LABELED "ELECTRIC VEHICLE CHARGING"). TO FOLLOW REQUIREMENTS PER CBSC 5.106.5.3.1.
   E. ACCESSIBLE ELECTRIC VEHICLE CHARGING STALLS, VAN, STANDARD, AND AMBULATORY.
8. NEW CONCRETE PEDESTRIAN WALKS. ASSUME ALL SIDEWALKS TO BE ACCESSIBLE PATH OF TRAVEL. SLOPE NOT TO EXCEED 1:20 (5%) IN DIRECTION OF TRAVEL. CROSS SLOPE NOT TO EXCEED 1:50 (2%) WHERE PARKING OVERHANG OCCURS, INCREASE WIDTH OF SIDEWALK TO 6'--0" MIN.
9. SEMI TRACTOR TRAILER TEMPLATE SHOWN FOR REFERENCE ONLY
10. 60' DEPRESSED CONCRETE TRUCK DOCK WITH CURB AND GUARDRAIL AT EACH SIDE
11. LOADING DOCK ROLL UP DOOR, TYPICAL
12. GRADE LEVEL ROLL UP DOOR, TYPICAL
13. PREFABRICATED PAINTED STEEL DOCK STAIR AND BOLLARDS
14. TRAILER PARKING STALLS WITH CONCRETE DOLLY PADS
15. DASHED LINE INDICATES 2'--0" PARKING OVERHANG
16. SEMI TRUCK AND TRAILER PARKING STALLS
17. POTENTIAL ELECTRICAL VEHICLE SERVICE EQUIPMENT (EVSE)
18. POTENTIAL SOLAR CANOPY -- MAY BE PLACED ABOVE ANY PARKING SPACE ON SITE
19. POTENTIAL SOLAR STORAGE BATTERIES
20. OMITTED
21. LIGHT DUTY PULL THROUGH CHARGING
22. MEDIUM DUTY / HEAVY DUTY TRUCK CHARGING
23. RENEWABLE DIESEL FUELING
24. RENEWABLE COMPRESSED NATURAL GAS FUELING
25. HYDROGEN FUELING
26. UP TO 15,000 SQ. FT. COMMERCIAL BUILDING WITH DRIVE THRU WINDOW

Notes

User approved volume balancing among the lanes for turning movement.

Unsignalized Delay for [EBR] is excluded from calculations of the approach delay and intersection delay.

HCM 7th LOS	B

Notes

User approved volume balancing among the lanes for turning movement.

Unsignalized Delay for [EBR] is excluded from calculations of the approach delay and intersection delay.

Appendix M
Conceptual Landscape Plan

ELECTRIC VEHICLE CHARGING STATION AND LOGISTICS FACILITY

LENWOOD ROAD
BARSTOW, CALIFORNIA

Landscape Development Plans

PLANTING NOTES

1. Installing Contractor shall verify quantities and areas to be planted prior to start of job. Notify Landscape Architect of any discrepancies prior to starting work.
2. All planting areas shall be completely free of trash, debris, rocks, and construction materials larger than 2", and shall be brought to finish grade before planting begins. Finish grade shall be 2" below surface of walks, curbs, and paved areas in planting areas where bark is to be installed. Grades shall be flush at catch basins. Surfaces shall be sloped with regard to drainage requirements so that water does not puddle or stand.
3. If additional soil is required, it shall be approved loam as similar to the existing soil as possible, free of debris and noxious weeds. Prior to placing additional soil, disc or scarify the sub-grade to a depth of at least 8" to permit bonding to the sub-grade. Spread and rototill a one inch layer of new soil, then proceed to place remaining soil and establish finish grade.
4. Landscape contractor must conduct a soils test to determine amendment quantities. For bid purposes, assume the following soil preparation for all planting areas: Apply nitrified wood product amendment at a minimum rate of 6 cubic yards per 1000 sq. ft. and commercial fertilizer (16-16-16 NPK or equal) at a rate of 30 lbs. per 1000 sq.ft. for shrub and ground cover areas, 20 lbs. per 1000 sq.ft. for lawn areas. Rototill to a depth of 6" to 10". Compact and settle all areas by application of heavy irrigation to a minimum depth of 12".
5. All plants shall be top quality nursery stock, free of disease and insect pests. Plants shall be normal size for container, vigorous, and true to name and variety. Plant holes shall be the same depth as the root ball, and three times the width for shrubs and four times the width for trees, see details.
6. Backfill for the plant holes shall be existing soil which has been previously amended. Apply Osmocote Controlled Release Formula fertilizer (18-6-12, 4 month formula) per manufacturer's recommendations.
7. When planted, crown of plant shall be 1-1/2" above finish grade. Prepare a water basin by forming a soil ring at least 3" high and as wide around the outer edge of the new plant hole. Water thoroughly to eliminate air pockets.
8. Upon completion of planting all containerized material, rake all shrub and ground cover areas to smooth grade, leaving watering basins intact. Prior to placement of rock mulch, all shrub and ground cover areas shall be treated with a pre-emergent herbicide (Ronstar or equal) per manufacturer's directions. Contractor to verify with manufacturer that pre-emergent will not adversely affect plant health.
9. Place a 3" layer of crushed rock mulch, or approved equal, in all shrub and ground cover areas.
10. Ground cover plants shall be planted in straight rows and evenly triangularly spaced a intervals noted in plant legend. Plant each rooted plant with its proportionate amount of rooting soil in a manner that will insure minimum disturbance of the root system.
11. Root barriers are required in all locations where trees are placed closer than 48" from curbs, sidewalks, concrete or asphalt. Refer to detail for specification and installation.
12. All standard trees require staking. Use two 2" diameter treated lodgepole stakes set at minimum of 12" into undisturbed subgrade below the root ball. Place ties and stakes only to the level which will hold the tree upright; proper height is 6" above the point where the tree will snap to an upright position by itself if the top is pulled to one side as if wind loaded and then released. Ties shall be cinch-tie flexible vinyl (or equal) nailed to stake with galvanized nails. Trim stakes to a height approximately 3" above ties. See also tree planting detail.
13. Contractor shall furnish all labor, material, equipment, and services required to maintain the landscape in an attractive condition as specified herein for a period of 90 days after final acceptance by Owner. Maintenance Period shall commence after all planting and related work has been completed to a substantial level of completion as determined by the Landscape Architect. A prime requirement of substantial completion is a fully operational irrigation system 100% healthy plant material. Any materials found to be dead, missing, or in poor condition during the Maintenance Period shall be replaced within 10 days of written notification by the Owner. Contractor shall not be held responsible for damage arising from acts of God, vandalism, theft, or negligence by Owner during the Maintenance Period.

IRRIGATION NOTES

1. Installing Contractor shall verify all dimensions and areas prior to start of job. Intent is for full coverage of planting. Notify Landscape Architect of any discrepancies prior to trenching.
2. Plan is diagrammatic and not intended to show exact locations of piping and valves. Install valves and piping in landscape areas wherever possible. Install valves near curbs and sidewalks whenever possible. Sprinkler head spacings are shown accurately and shall be installed as indicated by the center of the symbol. Contractor is responsible for pipe sizing the irrigation system correctly.
3. All materials shall be new and in perfect condition. No deviations from the specifications will be allowed without prior written approval of Landscape Architect.
4. Mainline shall be SCH 40 PVC or CL 315 PVC at a minimum depth of 18" below finish grade. Lateral lines shall be SCH 40 PVC or CL 315 PVC at a minimum depth of 12" below grade. Use only the solvent supplied and recommended by the pipe manufacturer to make plastic pipe joints. Allow 15 minutes set-up curing time before moving or handling, and 24 hour curing time before water is placed in PVC pipe. Center load pipe with a small amount of backfill to prevent arching and whipping under pressure.
5. Where more than one pipe is installed in a trench, place pipe side by side at a minimum of 2" apart. Where soil conditions are rocky, place a 4" layer of fine material on bottom of trench prior to installation of pipe.
6. All valves shall be installed in Carson poly-plastic valve boxes with flush covers, or approved equal. Remote control valves shall be installed in Carson 1419 12" depth standard rectangular valve boxes; Drip zone remote control valves with filters and PRVs shall be installed in Carson 1220 12" depth jumbo rectangular valve boxes; Ball valves shall be installed in Carson 0011 10" diameter round valve boxes. Top of valve boxes shall be 1" above finish grade.
7. Securely mount controller as directed by manufacturer. Complete all electrical connections to controller. All control wire shall be #14 U.L. direct burial. Taped and bundled every 20'. Place at a minimum depth of 18", installing in common trenches with mainline whenever possible. Where wire crosses paving, encase wire in a SCH 40 PVC sleeve. Run one extra wire, of a different color, to the last valve on each mainline leg, looping the wire through each valve box and label for future use.
8. At valves, both wires shall be brought into valve box and shall have an excess loop of 24" before being spliced into the solenoid pigtails using Pentite connectors.
9. After valves have been installed, test all mainlines for leaks at full line pressure for a period of 2 hours with couplings exposed and pipe sections center loaded. Before testing, fill line with water for at least 24 hours. Provisions shall be made for thoroughly bleeding the line of air and debris. Correct all defects and retest.
10. All excavations shall be backfilled with fine material to 4" above crown of pipe and tamped; then fill with earth and tamp. All trenches shall be left flush with adjoining grade and in a firm unyielding condition. Any subsequent settling shall be corrected by the Contractor.
11. Install systems without drip emitters. Open valves. Flush and operate each valve system at full pressure until all debris is removed. Install drip emitters.
12. Test to determine that all sprinklers function according to manufacturer's data and give full coverage according to intent of drawing. Replace and adjust as necessary. Additional heads shall be provided by the Contractor to cover areas shown to be deficient by test.
13. Contractor shall set initial program for the controller. Contractor shall provide Owner with the instruction manual and demonstrate its operation to the Owner.
14. Contractor shall guarantee all parts and labor for one year with exception of damage caused by vandalism, theft, adverse natural conditions, or anything beyond the control of the Contractor.

GENERAL NOTES

1. Landscape areas not covered with live material shall be covered with a 3" layer of rock mulch.
2. Adjust location of plant material to avoid interference with building numbers and addresses at mature height.
3. Provide a minimum three foot clearance around all fire protection equipment and associated landscape apparatus.
4. All trees planted adjacent to fire lanes shall have their canopies maintained at 13'-6" or higher where they overhang into the required width of the fire lane.
5. Landscaping shall be placed and pruned as to retain the required clearance for ladder access to windows around the building and to not interfere at maturity with 13'-6" emergency vehicle access clearance.
6. Landscape contractor shall provide protection for all concrete surfaces when installing landscape materials. Staining of concrete from dirt, tire marks and damaged curbs will not be permitted. All damaged surfaces shall be cleaned or replaced.
7. Landscape contractor shall coordinate and install the sleeving and stubbing for irrigation crossing parking lots and paved areas.
8. Landscape contractor shall grade all landscape areas 2% min. to drain to the street or drain inlet. Landscape contractor is responsible to provide positive drainage away from all buildings. All planters and planter islands should be crowned to prevent standing water.
9. Quantities found in the plant legend are for contractor convenience. In the event that the quantities in the legend differ from those found on the plans, the quantities found on the plans will take precedence.

PLANTING NARRATIVE

The proposed landscape plant palette consists of low water use shrubs, groundcover, trees, and ornamental grasses that are considered low maintenance, hardy and appropriate in USDA Zone 11 and the City of Barstow, CA.

Evergreen trees are used to screen truck parking areas and loading dock doors, providing year-round visual buffering. Plant selection is guided by fire safety requirements and the site's solar exposure and climatic conditions. Species are chosen for their longevity, emphasizing durable, long-lived varieties of trees, shrubs, groundcovers, and grasses.

Shrubs and groundcover are minimum #1 size. Trees are minimum #15 size with ½ being 24" box. Plant materials shall be spaced to provide substantial cover, but also to allow adequate room to mature into their natural form and ultimate size without required pruning.

IRRIGATION NARRATIVE

The irrigation system will be serviced by a new point of connection. The irrigation design will consist of low volume drip irrigation. Proposed trees shall utilize bubbler irrigation to encourage deep root watering. The overall irrigation system will be designed with a smart irrigation controller. A weather sensor will be used to automatically adjust duration of application in accordance with recent weather conditions based on evapotranspiration. Maximum water allowance will be determined by State code. To also be consistent with the planting design, the irrigation design will create separate irrigation stations by hydrozone, locating plants of different water and solar needs into groups.

LANDSCAPE PERCENTAGE

SITE AREA	4,214,069 s.f.
REQUIRED LANDSCAPE PERCENTAGE	15%
LANDSCAPE AREA (NIC PARKING AREAS)	667,607 s.f.
LANDSCAPE PERCENTAGE PROVIDED	15.8%

FRONTAGE TREE REQUIREMENTS

FRONTAGE LANDSCAPE LENGTH	2,920 L.F.
TREES REQUIRED	ONE TREE / 30 L.F. = 97 TREES REQUIRED
TREES PROVIDED	138 TREES

TREE SIZE REQUIREMENTS

TOTAL TREES	955 TREES
TREES REQUIRED TO BE 24" BOX	33% OF TOTAL # OF TREES = 315 TREES
24" BOX TREES PROVIDED	324 TREES
